## CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the areas of Computer Science & Applications; Commerce; Business; Finance; Marketing; Human Resource Management; General Management; Banking; Economics; Tourism Administration & Management; Education; Law; Library & Information Science; Defence & Strategic Studies; Electronic Science; Corporate Governance; Industrial Relations; and emerging paradigms in allied subjects like Accounting; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Rural Economics; Co-operation; Demography; Development Planning; Development Studies; Applied Economics; Development Economics; Business Economics; Monetary Policy; Public Policy Economics; Real Estate; Regional Economics; Political Science; Continuing Education; Labour Welfare; Philosophy; Psychology; Sociology; Tax Accounting; Advertising & Promotion Management; Management Information Systems (MIS); Business Law; Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labour Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; International Relations; Human Rights & Duties; Public Administration; Population Studies; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism & Hospitality; Transportation Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic; Web Design and emerging paradigms in allied subjects.

Anybody can submit the **soft copy** of unpublished novel; original; empirical and high quality **research work/manuscript anytime** in ***M.S. Word format*** after preparing the same as per our **GUIDELINES FOR SUBMISSION**; at our email address i.e. [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com) or online by clicking the link **online submission** as given on our website ([FOR ONLINE SUBMISSION, CLICK HERE](#)).

## GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: \_\_\_\_\_

**THE EDITOR**  
IJRCM

**Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF**

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

**DEAR SIR/MADAM**

Please find my submission of manuscript entitled '\_\_\_\_\_ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

**NAME OF CORRESPONDING AUTHOR:**

Designation:  
Affiliation with full address, contact numbers & Pin Code:  
Residential address with Pin Code:  
Mobile Number (s):  
Landline Number (s):  
E-mail Address:  
Alternate E-mail Address:

**NOTES:**

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:  
**New Manuscript for Review in the area of** (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers, and email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

**INTRODUCTION****REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure. Sources of data should be mentioned below the table/figure.** It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
  - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
  - Use (ed.) for one editor, and (ed.s) for multiple editors.
  - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
  - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
  - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
  - For titles in a language other than English, provide an English translation in parentheses.
  - The location of endnotes within the text should be indicated by superscript numbers.

**PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:****BOOKS**

- Bowersox, Donald J., Closs, David J., (1996), "Logistical Management." Tata McGraw, Hill, New Delhi.

### ABSTRACT

Forecasting is an important component in the decision making process, because decisions reflect future events. Furthermore, financial forecasting is an important activity in economic decision-making. Since the cash flows are a basis for payment of dividends, interest and debt repayment and so on, users need to forecast future cash flows. In this paper, utility of accounting accruals in predicting future cash flows were investigated using the semiotics theory in Iranian companies. To this end, 60 firms were selected on the Tehran Stock Exchange and their financial information were analyzed by a valid method that called Radial Basis Function (RBF for the first time) in Iran. The evidence indicate that accounting accruals (that based on performance can be divided into two categories: syntactic and semantic accounting accruals) have information value. Furthermore, they are effective in predicting future operating cash flows. Accounting accruals also improve predicting of future operating cash flows when added to cash item.

### KEYWORDS

Operation cash flows, Semiotic theories of accounting accruals, Syntactic accounting accruals, Semantic accounting accruals, Radial Basis Function (RBF) Networks.

### INTRODUCTION

In today's world, accounting was not very successful without the theoretical framework and foundations. Accounting theory is a logical reasoning system that provides a framework for building universal principles. These principles used to evaluate the procedure of accounting and they are also guidelines for the development of new methods in accounting (Ghaemi, 1996). Theory in its broad sense means to describe and predict a phenomenon. In fact, the theory finds a correlation between past events that can be extended to future or to predict unobserved events (Pur Azarsa, 1985).

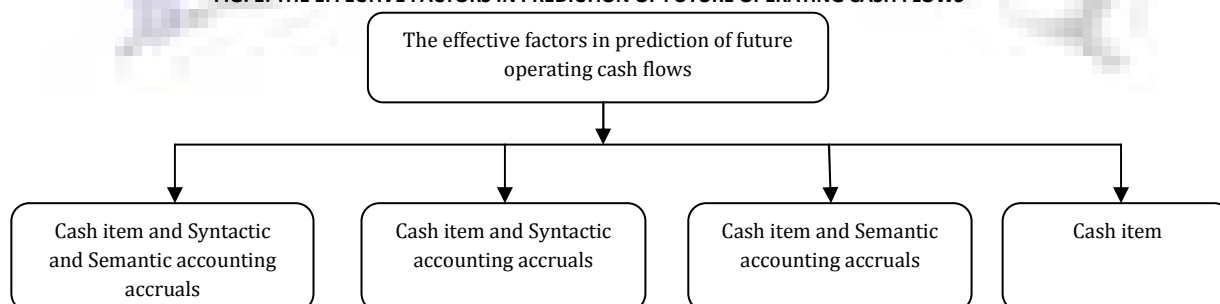

Semiotic theory of accounting accruals is one of theories that do to the focus on accounting reporting aspect has critical importance. This theory looks at the accounting from the standpoint of linguistics. Two basic theories of semiotics theory are:

- 1) Theory of the functions of accounting accruals: This theory classifies accounting accruals based on their performance and expresses that there are two main types of accruals: semantic accounting accruals and syntactic accounting accruals.
- 2) Theory of the pragmatic information of accounting accruals: This theory explains why accruals accounting have information value (information content) and it also states that semantic and syntactic accounting accruals have information content because they improve prediction of future cash flows when add to cash item.

Since accounting can be considered as a kind of language, aspects of reporting accounting should be part of the evolution of accounting. Theories that describe the process of reporting should be improving the meaning of accounting reporting and their components (Etheridge and Hsu, 2004).

Accrual accounting is one of component of accounting reporting that we can examine it by reporting theory. Semiotic theory of accounting accrual has been noticeable for Researchers in recent decades. On one hand, these signs offer the current status of firm's perspective and the other hand, they allowing users to make more accurate predictions of the future status, especially for predicting of future cash flows. However the accrual accounting reduce scheduling problems and inconsistencies inherent in the cash figures, but usefulness and reliability of accruals accounting are dubitable. Due to considering the estimative and subjective nature of these items managers can be manipulate them to adjust the reported earnings that prepare by accepted accounting principles. Hence, despite the consensus about the usefulness of accounting accruals in forecasting and decision making, there are some dissidents among experts (Arabmazar et al, 2006). Therefore, this study examined the objective and usefulness of accounting accruals by semiotic, theory of signs and symptoms, with a valid method that called Radial Basis Function Networks. The theoretical foundations performed by researchers indicate that accounting accruals have information content (e.g. the relationship between accruals and return on equity (Seifi,2006), the role of accruals and cash flows in the valuation (Ali Ahmadi, 2005), examining the relationship between profitability current cash flow and accounting accruals with future operation cash flows (Taheri, 2005). Figure 1 shows Effective factors in prediction of future operating cash flows.

**FIG. 1: THE EFFECTIVE FACTORS IN PREDICTION OF FUTURE OPERATING CASH FLOWS**

In the following are expressed literature review, hypotheses and methods of research, and finally findings of research and conclusions are presented.

## LITERATURE REVIEW

Barth et al (2001) in a study entitled "accruals and prediction of future cash flow" examined the relationship between operating cash flow and accrual components of earnings using multivariate regression models. The results showed that the accounting accrual component of earnings increases predictability of future cash flows, markedly. Etheridge and Hsu (2004) in a research entitled "using artificial neural networks to examine semiotic theories of accounting accruals" examined the theory of semiotics accruals. In this study the theory of pragmatic information of accounting accruals and theory of the functions of accounting accruals were presented. As well as researchers used an artificial neural network. They predicted future cash flows using the cash item and cash item with accounting accrual. They found error rate of prediction is reduced by adding accounting accruals to the cash item. Thus it can be expressed that the accounting accruals have information content.

Saghafi (2006) in his research presented an efficient model for predicting of cash flow for companies that listed in Tehran Stock Exchange. He compared his model with other models. Based on the results, models that use cash item have higher error rate compared to models that using accounting accruals. Khajavi and Nazemi (2006) in their studies Investigated financial statements of 96 companies during the period 1998 to 2003. Their results showed that average stock returns do not affect on the accrual accounting amounts and related components. In other words, there is not a significant difference in average of return of companies with the lowest and the highest figure of accounting accruals.

Arab Mazar Yazdi et al (2006) have investigated the information value of accounting accruals and cash flows in capital market of Iran. The results show that earnings have higher information content than operating cash flows. On the other hand, other researches in this area implies the increasing information content of accounting accruals compared to the operating cash flows.

Bracket et al (2007) concluded that the average absolute prediction errors for future cash flows when accruals are added as a predictor of operating cash flows, is smaller than when the cash flows from operations are used alone as a predictor.

Hashemi et al (2010) in a study evaluated capability of cash and accrual components of earnings in prediction of abnormal earnings and valuation of the companies listed on the Stock Exchange. The results show that cash flows and total accounting accruals affect on the value of the companies and prediction of abnormal earning. Another result of this study shows that the component of accounting accrual can forecast abnormal earnings, although only some of the coefficients of accounting accruals component are statistically significant.

## RESEARCH HYPOTHESES

Based on the theoretical foundations this study is to investigate the effect of accounting accruals on predicting of future cash flows. It will answer the question whether accounting accruals improves prediction of future cash flow or not. Therefore, the following hypotheses have been developed to answer these questions:

Hypothesis 1: Adding up of syntactic accruals to cash items can improve prediction of future operating cash flows.

Hypothesis 2: Adding up of semantic accruals to cash items can improve prediction of future operating cash flows.

Hypothesis 3: Adding up of syntactic and semantic accruals together to cash items can improve prediction of future operating cash flows.

Hypothesis 4: Syntactic and semantic accruals equally improve prediction of future operating cash flows.

## SAMPLE SELECTION AND DATA COLLECTION

Sample of this research consists of listed companies on the Stock Exchange. Due to the vast volume of sample, the under following conditions were considered for selection of sample:

1. The company should be listed on Tehran Stock Exchange from the beginning of 2007 financial year.
  2. The every financial year of the company should end in March.
  3. The company should not change the financial year from 2009 to 2011.
  4. The company should not be a financial trading company or an investment company.
  5. Consistency should be observed during the studied period during 2007 to 2009.
  6. Operating cash flows, accounting accrual components of earnings and balance sheet data should be available for entire period under examination.
- Among the companies listed on Tehran Exchange that have all of the above conditions, 60 companies were selected during 2009 to 2011.

## VARIABLE OF RESEARCH

Independent variables are:

- 1 - Cash Items,
- 2 - Cash Items with syntactic accounting accruals items,
- 3 - Cash items with semantic accounting accruals items,
- 4 - Cash Items with syntactic and semantic accounting accruals items,

Dependent variable in this research is the annual operating cash flow of future.

## RESEARCH METHODOLOGY

Artificial neural networks are models for information processing that built by mimic from biological neural networks, like a human brain. The Key element of these patterns is a new structure for data processing system. Artificial neural networks with processing on the experimental data are extracted knowledge or hidden lows beyond the data and transferred it to the network structure. These processes are called Learning. Essentially the most important feature of an intelligent system is learning ability.

The learner systems are more flexible and planned simply, so they can be held accountable on new issues and equations. Firstly, this research was used artificial intelligence techniques (Radial Basis Function Networks) in order to organize the relationship between dependent and independent variables and forecasting future operating cash flow. Network was trained in 2009 by operating cash item and tested by data in 2010 for each of the independent variables. In the end, the designed network was predicted future operating cash flow by four independent variables.

## RADIAL BASIS FUNCTION NETWORKS

Networks with radial based function widely used to estimate the non-parametric multi-dimensional functions through a limited set of training data. Due to the rapid and widespread training of radial neural network, they are extremely interesting and useful. Radial basis functions (RBF) networks have been introduced by Broomhead and Lowe (1998). It is one of the leading networks with three layers: an input layer, a hidden layer with a non-linear RBF activation function and a linear output layer (see Fig.2).

FIG. 2: ARCHITECTURE OF A RADIAL BASIS FUNCTION NETWORK

(Broomhead & Lowe ,1998).

The input modeled as a vector of real numbers  $\mathbf{x} \in \mathbb{R}^n$  and then output of the network is a scalar function of the input vector,  $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}$ , and is calculated by

$$\varphi(\mathbf{x}) = \sum_{i=1}^N a_i \rho(\|\mathbf{x} - \mathbf{c}_i\|)$$

In this equation N is the number of neurons in the hidden layer and  $\mathbf{c}_i$  is the center vector for neuron i, and  $a_i$  is the weight of neuron i in the linear output neuron. Functions that depend only on the distance from a center vector are radially symmetric about that vector, hence the reason this is called radial basis function. In the basic state all inputs are attached to each hidden neuron. The norm is frequently taken to be the Euclidean distance and the radial basis function is typically taken to be Gaussian

$$\rho(\|\mathbf{x} - \mathbf{c}_i\|) = \exp[-\beta \|\mathbf{x} - \mathbf{c}_i\|^2]$$

The Gaussian basis functions are local to the center vector in the event that

$$\lim_{\|\mathbf{x}\| \rightarrow \infty} \rho(\|\mathbf{x} - \mathbf{c}_i\|) = 0$$

By having certain mild conditions on the figure of the activation function, RBF networks are universal approximators on a compact subset of  $\mathbb{R}^n$  (Park & Sandberg ,1991) This means that an RBF network with enough hidden neurons can approximate any continuous function with arbitrary precision. The parameters  $a_i$ ,  $\mathbf{c}_i$ , and  $\beta_i$  are defined in a manner that optimizes the fit between  $\varphi$  and the data (Broomhead and Lowe ,1998)

**DESIGN AND IMPLEMENTATION OF RBF NETWORKS**

After data collection, the data were cleaned and prepared. it means that absent, incomplete or not calculable data are removed. After normalizing, the data are divided into two categories: learning and test. Network builds model by learning data and assessment model with test data. The results of the models related to the first, second and third hypotheses are presented in Tables 1,2 and 3.

TABLE 1: PREDICTIVE ACCURACIES (%) OF RBF NETWORK BY ADDING UP OF SYNTACTIC ACCRUALS TO CASH ITEMS

|                         | Accuracy | The correlation coefficient | Error type I | Error type II |
|-------------------------|----------|-----------------------------|--------------|---------------|

**DATA ANALYSIS**

In this section the observations of standard error will be described and evaluated in different situations.

TABLE 4: DESCRIPTIVE STATISTICS FOR THE OBSERVATION

| Descriptive criteria  | Total | Average | Minimum | Maximum | Standard deviation | Skewness coefficient |
|---|-------|---------|---------|---------|--------------------|----------------------|
| Error Metric of prediction of future operating cash flow considering cash items                                     | 60    | 546/1   | 011/0   | 263/44  | 789/5              | 085/7                |
| Error Metric of prediction of future operating cash flow considering cash items and syntactic accruals              | 60    | 466/1   | 010/0   | 887/66  | 598/8              | 719/7                |
| Error Metric of prediction of future operating cash flow considering cash items and semantic accruals               | 60    | 375/0   | 004/0   | 010/6   | 823/0              | 832/5                |
| Error Metric of prediction of future operating cash flow considering cash items and syntactic and semantic accruals | 60    | 216/0   | 002/0   | 220/1   | 263/0              | 534/2                |

The results in table 4 show that the highest average standard error of prediction occurs when no accruals have been added to it. So adding syntactic and semantic accounting accruals decreases the average standard error of prediction. In the first column of the above table represent the number 60 that implies there is no missing observation. Skewness coefficient in the last column indicates that none of the standard error s has not normally distributed. As well as, normality assumption is examined in more in detail.

The hypothesis tested in this study by SPSS and MATLAB software. Average standard errors were calculated based on each of the independent variables. For determining the appropriate test methods in inferential statistics basic assumption is normality of the observations that we have collected. This work was performed by Kolmogrov-Smirnov test. Since the observations weren't normal, we used nonparametric statistical methods specifically Wilcoxon test. Also the correlation coefficient was used to endorsing the result.

In this section to assess the impact of cash item, cash item and syntactic accounting accruals, cash item and semantic accounting accruals and cash item and semantic and syntactic accounting accruals on predicting of operating cash flows the test Kolmogrov - Smirnov done. Since all four cases in the Table 6, the significance level is less than 0.05 (P< 0.05) the normality assumption will be rejected in all cases.

TABLE 5: ONE-SAMPLE KOLMOGOROV- SMIRNOV TEST

| Normality test     | Error Metric related to adding syntactic accruals to cash items | Error Metric related to adding semantic accruals to cash items | Error Metric related to adding syntactic and semantic accruals to cash items | Error Metric associated with considering only |
|--------------------|---|--|--|---|
| Mean               | 0.0094  | 0.0061   | 0.0085   | 0.0041  |
| Standard Deviation | 0.0228  | 0.01321  | 0.02334  | 0.01058                                       |
| Z                  | 1.642   | 1.597  | 1.514  | 1.507   |
| p- value           | 0.009   | 0.012  | 0.02   | 0.021   |

Due to observations weren't normal, we used to Wilcoxon test at the 5% level that is a non-parametric test. Furthermore, the results of RBF network were tested by Wilcoxon test.

**THE FIRST HYPOTHESIS TEST**

According to table 1, it is seen that the correlation coefficient of 0.986 and this figure is closer to 1. It means that syntactic accounting accruals have a direct and perfect relationship with operating cash flow and adding up of syntactic accruals to cash items can improve prediction of future operating.

TABLE 6: WILCOXON TEST FOR DIFFERENCES OF ERROR METRIC OF THE PREDICTION OF OPERATING CASH FLOW IN TWO MODES (CONSIDERING ONLY CASH ITEM-CONSIDERING CASH ITEMS ADDED WITH SYNTACTIC ACCRUALS)

|                               |                     |
|-------------------------------|---------------------|
| Test Statistics <sup>b</sup>  | <sup>a</sup> -2.711 |
| Asymp. Sig. (2- tailed)       | 0.007               |
| a. Based on positive ranks.   |                     |
| b. Wilcoxon Signed Ranks Test |                     |

Also Wilcoxon test results in table 6 show that significant level is 0.007 and less than 0.05 (P <0.05), therefore, with the probability of 95%, we conclude that there is a significant difference between the Error Metric of the prediction of operating cash flow in only cash items and cash items added with syntactic accruals. Therefore the first hypothesis is accepted at level 0.05%.

**THE SECOND HYPOTHESIS TEST**

According to table 2, it is seen that the correlation coefficient of 0.9994 and this figure is closer to 1. It means that semantic accounting accruals have a direct and perfect relationship with operating cash flow and adding up of semantic accruals to cash items can improve prediction of future operating.

TABLE 7: WILCOXON TEST FOR DIFFERENCES OF ERROR METRIC OF THE PREDICTION OF OPERATING CASH FLOW IN TWO MODES (CONSIDERING ONLY CASH ITEM-CONSIDERING CASH ITEMS ADDED WITH SEMANTIC ACCRUALS)

|                               |                    |
|-------------------------------|--------------------|
| Test Statistics <sup>b</sup>  | <sup>a</sup> -2195 |
| Asymp. Sig. (2- tailed)       | 0.028              |
| a. Based on positive ranks.   |                    |
| b. Wilcoxon Signed Ranks Test |                    |

Wilcoxon test results in table 7 indicate that significant level is 0.028 and less than 0.05 (P <0.05), therefore, with the probability of 95%, we conclude that there is a significant difference between the Error Metric of the prediction of operating cash flow in only cash items and cash items added with semantic accruals. Therefore the first hypothesis is accepted at level 0.05%.

**THE THIRD HYPOTHESIS TEST**

According to table 3, it is seen that the correlation coefficient of 0.9994 and this figure is closer to 1. It means that semantic accounting accruals have a direct and perfect relationship with operating cash flow and adding up of semantic and syntactic accruals to cash items can improve prediction of future operating.

TABLE 8: WILCOXON TEST FOR DIFFERENCES OF ERROR METRIC OF THE PREDICTION OF OPERATING CASH FLOW IN TWO MODES (CONSIDERING ONLY CASH ITEM-CONSIDERING CASH ITEMS ADDED WITH SEMANTIC AND SYNTACTIC ACCRUALS)

|                               |                     |
|-------------------------------|---------------------|
| Test Statistics <sup>b</sup>  | <sup>a</sup> -1.420 |
| Asymp. Sig. (2- tailed)       | 0.004               |
| a. Based on positive ranks.   |                     |
| b. Wilcoxon Signed Ranks Test |                     |

Wilcoxon test results in table 8 show that significant level is 0.004 and less than 0.05 (P <0.05), therefore, with the probability of 95%, we conclude that there is a significant difference between the Error Metric of the prediction of operating cash flow in only cash items and cash items added with semantic and syntactic accruals. Therefore the first hypothesis is accepted at level 0.05%.

**THE FORTH HYPOTHESIS TEST**

For the fourth hypothesis, we should compare the results of first and second hypothesis. If ratio of division of MSE and RMSE of hypothesis be less than 1, efficiency of a hypothesis to another hypothesis is accepted. Therefore, Based on the results in Table 9, adding up semantic accounting accruals item cash items in prediction of operation cash flow is much more improvement than adding up syntactic accounting accruals item . Therefore syntactic and semantic accruals don't improve prediction of future operating cash flows equally and forth hypothesis is rejected.

TABLE 9: THE RESULTS OF COMPARISON OF HYPOTHESES

| hypothesis | items   | Division MSE | Division RMSE |
|------------|---|--------------|---------------|
| 1          | Cash items/ syntactic accruals+ cash items              | 1.2774       | 1.1307        |
| 2          | Cash items/ semantic accruals+ cash items               | 0.2975       | 0.5454        |
| 3          | Cash items/ syntactic and semantic accruals+ cash items | 1.91442      | 1.3837        |

## CONCLUSION

This study examines the role of information content of accounting accruals. In this regard, four hypotheses were proposed. After normalization of data, four models were presented by Radial Basis Function networks for every hypothesis. Results show that syntactic and semantic accounting accruals have information content in prediction of future operation cash flows and as a result, first, second and third hypotheses is accepted. Furthermore, syntactic and semantic accruals don't improve prediction of future operating cash flows equally and this leads to the fourth hypotheses is rejected.

## RECOMMENDATIONS FOR FURTHER RESEARCH

Research findings showed that semiotic theory of accounting accruals can be used to predict future operating cash flows and it can provide useful information for users (managers, investors, creditor and so on). Therefore, we propose the following research for future:

1. Dividing of accounting accruals items into its components and then comparing of the results for finding that which component have better prediction of future operating cash flow.
2. Separation of firms according to their industry and its effect on different industry.
3. Comparison of cash item and accounting accrual data to predict future cash flows using the quarterly financial information.
4. Predict operating cash flows in companies such as investment firms, insurance and banking using cash and accounting accrual data.
5. Predict cash flows using stock market and investment information.

## **REQUEST FOR FEEDBACK**

**Dear Readers**

At the very outset, International Journal of Research in Computer Application & Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com) for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com).

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

**Academically yours**

Sd/-

**Co-ordinator**

## ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
