CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the area of Computer, Business, Finance, Marketing, Human Resource Management, General Management, Banking, Insurance, Corporate Governance and emerging paradigms in allied subjects like Accounting Education; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Monetary Policy; Portfolio & Security Analysis; Public Policy Economics; Real Estate; Regional Economics; Tax Accounting; Advertising & Promotion Management; Business Education; Management Information Systems (MIS); Business Law, Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labor Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; Public Administration; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism, Hospitality & Leisure; Transportation/Physical Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Digital Logic; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Multimedia; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic and Web Design. The above mentioned tracks are only indicative, and not exhaustive.

Anybody can submit the soft copy of his/her manuscript **anytime** in M.S. Word format after preparing the same as per our submission guidelines duly available on our website under the heading guidelines for submission, at the email addresses: infoijrcm@gmail.com or info@ijrcm.org.in.

GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: _____

THE EDITOR
IJRCM

Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF.

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

DEAR SIR/MADAM

Please find my submission of manuscript entitled ' _____ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

NAME OF CORRESPONDING AUTHOR:

Designation:
Affiliation with full address, contact numbers & Pin Code:
Residential address with Pin Code:
Mobile Number (s):
Landline Number (s):
E-mail Address:
Alternate E-mail Address:

NOTES:

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:
New Manuscript for Review in the area of (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers, and email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

INTRODUCTION**REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure**. **Sources of data should be mentioned below the table/figure**. It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
 - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
 - Use **(ed.)** for one editor, and **(ed.s)** for multiple editors.
 - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
 - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
 - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
 - For titles in a language other than English, provide an English translation in parentheses.
 - The location of endnotes within the text should be indicated by superscript numbers.

PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:**BOOKS**

- Bowersox, Donald J., Closs, David J., (1996), "Logistical Management." Tata McGraw, Hill, New Delhi.

VALIDATION AND EVALUATION OF BURNOUT AMONG NURSES**DR. BEJOY JOHN THOMAS****HEAD****JAMAL INSTITUTE OF MANAGEMENT****JAMAL MOHAMED COLLEGE****TIRUCHIRAPPALLI****DR. G. S. DAVID SAM JAYAKUMAR****ASST. PROFESSOR****JAMAL INSTITUTE OF MANAGEMENT JAMAL MOHAMED COLLEGE****TIRUCHIRAPPALLI****ABSTRACT**

Nursing personnel in the hospital play key role in delivery of health care services. People working in an environment, often filled with tension and unpredictable situations, are vulnerable to physical and psychological distress, and can become burnt out. The study tried to explore the validity of Maslach's burnout inventory for South Indian nurses, to measure the structural relationship between Burnout and its dimensions Emotional Exhaustion, Depersonalization and Personal Accomplishment and to identify the relationship between the dimensions of Burnout. Majority of the nurses were female, married and in the age group of 21 to 30 years. The method of Data collection adopted for the study was personal interview using a structured questionnaire. Job burnout was measured with 22 items of Maslach's Burnout Inventory. Confirmatory factor analysis (CFA) using AMOS 16.0 validated the measurement model prior to examining the hypothesized relationships. Structural equation modeling (SEM) analysis was employed to test the hypothesized relationships. The confirmatory factor analysis indicates that the measurement model of Maslach's inventory is valid for measuring the burnout of nurses. The hypothesized structural model indicated that when emotional exhaustion & Depersonalization increases among nurses it does not lead to an increase in burnout of nurses. Also, when nurses have a low score in personal accomplishment it leads to increased burnout. Therefore, the study indicates that nurses experience emotional exhaustion and act in a depersonalized manner during the course of their work. But, these factors do not lead to burnout among nurses. The structural model highlights that less personal accomplishment among nurses leads to increased burnout.

KEYWORDS

Burnout, South Indian Nurses, Maslach's burnout inventory, Confirmatory Factor Analysis, Structural Equation Modeling, AMOS.

INTRODUCTION

Hospital is an integral part of a social and medical organization, the function of which is to provide for the population a complete health care, both curative and preventive, and whose outpatient services reach out to the family and its home environment; the hospital is also a centre for the training of health workers for bio social research. A hospital, in the modern sense, is an institution for health care providing patient treatment by specialized staff and equipment, and often, but not always providing for longer-term patient stays. In the health care organization, work stress may contribute to absenteeism and turnover, both of which detract from the quality of care. Hospitals in particular are facing a workforce crisis. The demand for acute care services is increasing concurrently with changing career expectations among potential health care workers and growing dissatisfaction among existing hospital staff. By turning toxic work environments into healthy workplaces, researchers and nurse leaders believe that improvements can be realized in recruitment. Nursing personnel in the hospital play key role in delivery of health care services. Resource crunch is the limiting factor to achieve efficient and effective service. Shortage of nurses is currently a problem in several countries and an important question is therefore how one can increase the supply of nursing staff. Shortage of professional staff in a hospital can drastically increase operating costs and compromise the quality care. It may not always be true that the more manpower will yield more output. Deployment of nursing personnel in ward areas always remained a controversial matter and is considered as the major causes of inter-personnel conflicts in hospitals. It is a tedious task to carry out healthcare delivery for the masses without rationalizing human resources in the form of reallocation and redeployment of health care personnel. People working in an environment, often filled with tension and unpredictable situations, are vulnerable to physical and psychological distress, and can become burnt out. The profession of nursing demands high levels of responsibility and knowledge. In addition, nurses are also frequently the target of the frustration, anger, and the suffering of the patient and his family. For nurses, as for many people working in a service profession, chronically stressful circumstances are the norm at work and impossible to avoid. Nursing is cited as one of the most susceptible professions to burnout. The phenomenon is a combination of symptoms such as other workers, the department (in which the burned out nurse works), the patients and their families, the organization, and the reputation of the profession has the potential to damage the individual. These stresses can lead to burnout.

CONCEPTUAL FRAMEWORK OF BURNOUT

Staff Burnout: The term burnout was originated by Freudenberg in 1974 to describe a mental status of professionals who had expended themselves on their occupation, and were thereby "burned out" and declining in not only level of performance at work, but also personalities. Maslach described burnout as a syndrome consisting of emotional exhaustion, depersonalization (treating patients in an unfeeling, impersonal way) and low personal accomplishment. Generally, the burnout syndrome occurs in all fields of public life, mainly in professions of nursing and social work. The symptoms of burn-out are categorized into psychic and somatic. Psychic symptoms range from loss of capability, enthusiasm, engagement, sense of responsibility; listlessness and indifference towards work; self-doubt and negative attitude; irritability, aggressiveness, impatience, nervousness; and tiredness, exhaustion and lack of interest leading to depression. The physical symptoms appear as in sleeping disorders, high disease susceptibility and psychosomatic complaints. The significance of the burnout syndrome may result in illness of nurses but it may lead to possibly inadequate care of patients. Burnout is also known as condition of emotional exhaustion, depersonalization, and a reduced sense of personal accomplishment that occurs among individuals who work with people in some capacity. The term "burnout" is first used to describe a syndrome of exhaustion observed among mental health professionals. The study of burnout had its genesis in the mid seventies when burnout was identified as a major problem among human service professionals. The study described burnout as a situation whereby clinical hospital staff including the medical doctor came to be inoperative. Since then there have been in excess of three thousand publications on the topic Freudenberg, H.J. (1974). **Emotional Exhaustion:** It is the most easily recognized of the three components of burnout. A nurse who is emotionally exhausted feels as if she has nothing left to give on a psychological level. This professional feels tired and has no mental strength to invest in work. The nurse's ability to be involved with and respond to the patients needs is diminished. Emotional exhaustion has documented behavioral and physical consequences including, but not limited to; low energy, chronic fatigue, gastrointestinal complaints and feelings of being frustrated, angered, chronically cynical and overly confident. **Depersonalization:** It is the second component of burnout that develops in response to emotional exhaustion. In depersonalization, the person develops cynical attitudes and feelings about the person they are caring for. Depersonalization can be a defense mechanism created in response to emotional exhaustion. The professional creates an emotional distance from the patient by moderating their compassion. It is an attempt to put an emotional distance between them and the patient to minimize the

emotional exhaustion. Unfortunately, this distancing forces the professional to ignore the very qualities that make them unique and engaging people. **Personal Accomplishment:** The two components i.e. emotional exhaustion and depersonalization, if left unaddressed, naturally lead to the final phase of burnout, which is a decreased sense of personal accomplishment. This decreased sense of personal accomplishment is manifested by decreased functioning levels at work. As this occurs her sense of accomplishment is eroded and she evaluates herself negatively in relation to her job.

The study will examine the relationship between Burnout and its dimensions for nurses working in Multispeciality hospitals in South India.

FIG. 1: RELATIONSHIP AMONG BURNOUT AND ITS DIMENSIONS

REVIEW OF RELATED LITERATURE

Burnout is frequently studied in populations of nurses for several reasons. These reasons include the fact that nursing is a large health care professional body; it has been linked to a high incidence of burnout (Jones, E. M. 1962) Burnout has its origins in physical, emotional or psychological demands as well as institutional demands. It has been argued that the basic causes of burnout lie with the disruptive emotional aspects of patient care, such as overly demanding patients, unreasonable patient behavior, illnesses, (especially those involved in contact and extreme pain and/or certainty of death) that are difficult to treat and which may lead to a strong emotional response from the nurse as well as recognition that there is sometimes denial by care givers to their emotional responses to a patients pain (Freudenberg, 1974; Freudenberg, 1975; Maslach et al., 2001; Maslach, 1982; Maslach & Jackson, 1984; Pines, Aronson, & Kafry, 1981). The assumption is that there exist a characteristic human tendency to expect some reward such as gratitude in return from others to whom we provide caring, empathy and attention. But within the health profession such expectations are often not fulfilled (Maslach, C., & Jackson, S.E. 1982). The authors of the Maslach Burnout Inventory (MBI) have yet to clarify the theoretical grounds for grouping these concepts together in the same cluster of symptoms (Maslach, C., & Jackson, S. E. 1982, 1986). Nonetheless, the question remains as to why some individuals are burned out while other individuals working in similar environments are not. The most likely explanation is that causes of burnout are found in both the individual and the environment (Kahill, S. 1988). Burnout is viewed as an affective reaction to ongoing stress whose core content is the gradual depletion over time of individuals' intrinsic energetic resources, including the expression of emotional exhaustion, physical fatigue, and cognitive weariness. Feelings of emotional exhaustion are generally considered a core symptom of the burnout syndrome (Shirom, 1989, p. 26). Review of the empirical evidence from 1974 to 1984 concluded that the influence of individual characteristics on burnout had largely been ignored. Since then significant relationships between burnout and demographic characteristics (e.g. marital status) have been reported (Russell, D. W., Altmaier, E., & Van Velzen, D. 1997). Depersonalization is defined as an attitude of negative, cynical, or excessively detached response to other people, representing the interpersonal component of burnout. Reduced personal accomplishment, resulting in feelings of decline in one's competence and productivity and in a lowered sense of self-efficacy, represents the self-evaluation component of burnout (Maslach, C. 1998). Patients may be worried, anxious and interaction with such individuals may not be rewarding. Among nurses there are high rates of emotional exhaustion and job dissatisfaction which is strongly associated with inadequate staffing and low nurse to patient's ratio. Emotional exhaustion is defined as the feeling of being depleted of one's emotional resources. This dimension was regarded as the basic individual stress component of the burnout syndrome (Maslach et al., 2001). Another dimension was relabeled as reduced efficacy or ineffectiveness, depicted to include the self-assessments of low self-efficacy, lack of accomplishment, lack of productivity and incompetence. These concepts—self-efficacy, accomplishment or achievement, personal productivity or performance, and personal competence—represent well Burnout has been recognised as an occupational hazard for a variety of people-centered professions, such as human services, education and health care (Maslach, C., Schaufeli, W. B., & Leiter, M. P. 2001). The very nature of nursing is based on empathy, compassion and humanization of medicine, and nurses as professionals are involved with people on an extremely personal level in an environment that is not always conducive to positive consequences (Buunk et al., 2001a). Burnout is a complex subject that has been studied as a sole concept as well as in conjunction with other workplace factors. A plethora of variables and interrelationships has been examined including organization and work-related factors. Most of the research that has examined causes of burnout has focused on conditions in the job environment and have found that role stressors, such as long hours, are associated with burnout (Cordes, C. L. & Dougherty, T. W. 1993, Handy, J. A. 1988. Schaufeli, W. B., Bakker, A. B., Hoogduin, K., Schaap, C., & Kladler, A. 2001). Burnout is also related to hopelessness, tardiness, and an intention to leave ones job in nursing (Mimura, C. & Griffiths, P. 2003.). In nurses occupational stress appears to vary according to individual and job characteristics, and work-family conflict. (Purvi Parikh, Atish Tawkari, Tanmay Bhattacharya, 2004). Moderate levels of stress are seen in a majority of the nurses. Incidence of psychosomatic illness increases with the level of stress. Healthcare organizations need to urgently take preemptive steps to counter this problem. (Pratibha P. Kane, 2009)

RESEARCH OBJECTIVES

- 1) To explore the validity of Maslach's burnout inventory for South Indian nurses.
- 2) To measure the structural relationship between Burnout and its dimensions Emotional Exhaustion, Depersonalization and Personal Accomplishment.
- 3) To identify the relationship between the dimensions of Burnout.

ABOUT THE STUDY

Nurses play a key role in caring and curing the patients. Also, nursing is a very rewarding and noble career. Nurses spend a short time with many patients and the patients are always in a state of not being well. It becomes difficult to experience relationships with people in these conditions. During such situations people are concerned for their own welfare and they are heavily dependent on nurses in taking care of them and providing them with reassurance of their recuperation. Hence it is not uncommon for nurses to experience "burnout". This leads to a burnout status in their personal and professional life which in turn causes problem, for their Hospital, patients, and colleagues and for themselves. Also, Maslachs burnout Inventory scale was used widely in the international health care sector for determining the burnout of nurses. The Maslachs burnout Inventory scale was used in Indian studies for measuring the burnout of employees working in

Information Technology Enabled Services sector. Hence a study on Burnout of South Indian nurses and its dimensions through Maslachs burnout Inventory was done among the nurses in multispecialty hospitals of South India.

RESEARCH METHODOLOGY

PERIOD OF THE STUDY

The study was conducted during the time period January, 2011 to May, 2011

PILOT STUDY

The pilot study was conducted among 20 nurses working in multispecialty hospitals of South India.

SAMPLE SIZE

The pilot study conducted among nurses of multispecialty hospitals indicated that the standard deviation of the nurses was 0.4418 and the sample size was calculated as 300 using the formula*.

SAMPLING METHOD

The sampling method adopted for the study was purposive sampling because the nurses working in multispecialty hospitals were selected based on the researchers judgment.

SAMPLE

Majority of the nurses were female, married and in the age group of 21 to 30 years. Most of them are diploma holders, working in the wards on 6 hr shift basis, having the job title as staff nurse and have experience of 1 to 5 years in the present hospital. Most of the nurses have working hours of about 40 to 49 hrs per week and earning more than 50,000 as annual

* $N = (z \times s/e)^2$ $Z = 1.96, e = 0.05$

income. Majority of the nurses are staying with their brothers or sisters.

MEASUREMENT

METHOD OF DATA COLLECTION

The method of Data collection adopted for the study was personal interview using a structured questionnaire.

SURVEY INSTRUMENT

The questionnaire used for this research contained 11 questions on demographic factors and 2 questions on number of hours worked per week & shift timing. Also, the questionnaire had 22 questions on job burnout.

JOB BURNOUT

Job burnout was measured with 22 items of Maslach Burnout Inventory. The respondents were asked to rate how they agreed with each of the statements in the questionnaire on a five-level Likert scale from "strongly disagree" (coded as one) to "strongly agree" (coded as five). The alpha reliability coefficient for the constructs emotional exhaustion, personal accomplishment and Depersonalization were 0.721, 0.708 and 0.725 respectively. Also, the alpha reliability coefficient for Burnout was 0.659.

DATA ANALYSIS AND RESULTS

Confirmatory factor analysis (CFA) using AMOS 16.0 validated the measurement model prior to examining the hypothesized relationships. Structural equation modeling (SEM) analysis was employed to test the hypothesized relationships. CFA generated 22 indicators to measure 4 latent constructs viz. Burnout, Emotional Exhaustion, Depersonalization & Personal Accomplishment as shown in Table 1. The χ^2 of 479.522(df = 206, p = 0.000, $\chi^2/df = 2.328$), Goodness of fit index (GFI) of 0.867, Comparative fit index (CFI) of 0.818 and Root mean square error of approximation (RMSEA) 0.067. All items loaded significantly (t-value > 1.96) on their corresponding latent constructs indicating that convergent validity was obtained. Construct reliabilities ranged from 0.71 – 0.73. Discriminant validity was supported based on the comparison between square root of the average variance extracted (AVE) of each pair of constructs and Φ^2 (i.e. the squared correlation between two constructs). Φ^2 did not exceed square root of the AVE between each pair of constructs as shown in Table 2. Overall, Discriminant validity was obtained.

TABLE 1: CONFIRMATORY FACTOR ANALYSIS RESULTS

Construct	SFL ^a	SE	t-value	Construct ^b Reliability	Extracted ^c variance
Emotional Exhaustion					
I feel emotionally drained from my work	0.561	-	-	0.721	0.72
I feel used up at the end of the work day	0.630	0.117	8.159		
I feel fatigued when I get up in the morning and have to face another day on the job.	0.556	0.123	7.499		
Working with people all day is really a strain for me	0.650	0.131	8.332		
I feel burned out from my work	0.620	0.124	8.077		
I feel frustrated by my job	0.521	0.116	7.154		
I feel I am working too hard on my job	0.137	0.101	2.163		
Working with people directly put us too much stress on me	0.445	0.114	6.339		
I feel like I'm at the end of my rope	0.148	0.101	2.330		
Personal Accomplishment	0.484	-	-	0.708	0.58
I can easily understand how my recipients feel about things					
I deal very effectively with the problems of my recipients	0.406	0.190	5.117		
I feel I'm positively influencing other people's lives through my work	0.446	0.213	5.452		
I feel very energetic	0.243	0.171	3.407		
I can easily create a relaxed atmosphere with my recipient	0.513	0.212	5.939		
I feel exhilarated after working closely with my recipients	0.578	0.202	6.337		
I have accomplished many worthwhile things in this job	0.633	0.226	6.611		
In my work, I deal with emotional problems very calmly	0.579	0.201	6.344		
Depersonalization				0.725	0.78
I feel I treat some recipient as if they were impersonal objects	0.590	-	-		
I've become more callous towards people since I took this job	0.504	0.116	7.296		
I worry that this job is hardening me emotionally	0.631	0.126	8.655		
I don't really care what happens to some recipients	0.490	0.117	7.128		
I feel recipients blame me for some of their problems	0.724	0.139	9.507		

Notes: ^aStandardized factor loading; the first item for each construct was set to 1;

^b Cronbachs alpha : ^ccalculated as $[\sum (\text{std loading}^2)] / [\sum (\text{std loading}^2) + \sum e_j]$;

$\chi^2 = 604.633$ (df = 254, p < 0.000); NFI = 0.918; CFI = 0.951; RMSEA = 0.068

TABLE 2: CORRELATIONS AND SQUARE ROOT OF THE AVE

Construct	1	2	3
1 Emotional Exhaustion	<i>0.85</i>	0.133	0.82
2 Personal Accomplishment	-0.365	<i>0.76</i>	0.339
3 Depersonalization	0.906	-0.582	<i>0.88</i>

Note: The diagonal italic numbers represent the square root of AVE where the lower diagonal area represents the correlation between each construct, and the upper area represents ϕ^2

TABLE 3: GOODNESS – OF – FIT MEASURES OF THE MEASUREMENT MODEL

Fit Indices	χ^2 / df	GFI	NFI	CFI	IFI	RMSEA	RMSR
Recommended value	≤ 3.0	≥ 0.8	≥ 0.9	≥ 0.9	≥ 0.9	$\leq 0.05 - 0.08$	≤ 0.1
Result value	2.33	.867	0.724	0.818	0.821	0.067	.341
Type of Fit	Good	Good	Medium	Close to Good	Close to Good	Good	Medium

Eight common model-fit measures were used to assess the model's overall goodness-of-fit: the ratio of χ^2 to degrees-of-freedom (χ^2/df); goodness-of-fit index (GFI); normalized fit index (NFI); comparative fit index (CFI); Incremental Fit Index (IFI); Root Mean Square Error of Approximation (RMSEA); and root mean square residual (RMSR). The ratio of χ^2 to degrees-of-freedom (χ^2/df) for the measurement model was calculated to be 2.33 which is within the accepted level of 3. The GFI was 0.867, which is greater than the 0.80 benchmark suggested by Doll et al. (1994). The NFI here was 0.724, which is not within the 0.90 benchmark suggested by Bentler (1989). The CFI here was 0.818, which is closer to the 0.90 benchmark suggested by Bentler (1989). The IFI here was 0.821, which is closer to the 0.90 benchmark suggested by Bentler (1989). The RMSEA was 0.067, which was within the recommended range of acceptability ($<0.05-0.08$) suggested by MacCallum et al. (1996). The RMR was 0.341 which was not within the recommended value of 0.1. The various goodness-of-fit statistics are summarized in Table and demonstrate the good overall fit of the measurement model to the data.

TESTING HYPOTHESES

SEM was conducted to test the hypothesized structural model. The result showed a Medium, model fit with the χ^2 of 2383.765 (df = 226, p = 0.000; $\chi^2 / df = 10.548$), NFI of 0.449, GFI of 0.828, and RMSEA of 0.179. Therefore, the research model was considered structurally fit by the conventional criteria for acceptable model fitness. The results of testing statistical hypotheses proposed in this study are shown in Figure 1 and Table 4. Hypothesis 1 which proposed that emotional exhaustion will have a significant positive effect on burnout was not supported with a path estimate of 0.312 (t-value = 1.831). Hypothesis 2, which proposed the significant negative effect of personal accomplishment on burnout, was confirmed based on a path estimate of 0.420 (t-value = 5.192). Hypothesis 3 which predicted that depersonalization will have a significant positive effect on burnout was not sustained with a path estimate of 0.257 (t-value = 1.282). As shown in Table 4, Hypotheses 1 and 3 were not supported, which indicated that when emotional exhaustion & Depersonalization increases among nurses it does not lead to an increase in burnout of nurses. Also, Table 4

Shows that when nurses have a low score in personal accomplishment it leads to increased burnout.

CORRELATION AMONG CONSTRUCTS

The table 5 shows the estimates of the correlation between the constructs emotional exhaustion, depersonalization and personal accomplishment. The table 5 shows that there is high positive correlation between emotional exhaustion and depersonalization, low negative correlation between emotional exhaustion and personal accomplishment and medium negative correlation between depersonalization and personal accomplishment. The table highlights that nurses with high emotional exhaustion will also have high depersonalization and vice versa, the nurses who have low personal accomplishment will have low emotional exhaustion and the nurses who have low personal accomplishment will have moderate depersonalization.

TABLE 4: STRUCTURAL PARAMETER ESTIMATES

Hypothesis	Path	Path Estimate	t-value	p-value	Result
H1	Emotional Exhaustion → Burnout	0.312	1.831	0.067	Not Supported
H2	Personal Accomplishment → Burnout	0.420	5.192	0.000**	Supported
H3	Depersonalization → Burnout	0.257	1.282	0.200	Not supported

*p-value < 0.05 ** p-value < 0.001

TABLE 5: CONSTRUCT CORRELATION

Correlation among Constructs	Estimates
Emotional Exhaustion ↔ Depersonalization	0.939
Emotional Exhaustion ↔ Personal Accomplishment	-0.223
Depersonalization ↔ Personal Accomplishment	-0.437

FIG.2. COVARIANCE STRUCTURAL MODEL FOR THE STUDY

(*p-value < 0.05, ** p-value) < 0.001

DISCUSSION AND IMPLICATION

The confirmatory factor analysis indicates that the measurement model of Maslach's inventory is valid for measuring the burnout of nurses. Hence, Maslach's inventory can be used to measure the burnout of nurses working in South Indian hospitals. The hypothesized structural model indicated that when emotional exhaustion & Depersonalization increases among nurses it does not lead to an increase in burnout of nurses. Also, when nurses have a low score in personal accomplishment it leads to increased burnout. Therefore, the study indicates that nurses experience emotional exhaustion and act in a depersonalized manner during the course of their work. But, these factors do not lead to burnout among nurses. The structural model highlights that less personal accomplishment among nurses leads to increased burnout. The correlation among constructs indicated that nurses with high emotional exhaustion will also have high depersonalization and vice versa, the nurses who have low personal accomplishment will have high emotional exhaustion and vice versa and the nurses who have low personal accomplishment will have moderate depersonalization and vice versa. Therefore, the study reveals there is high correlation between emotional exhaustion and depersonalization, less negative correlation between emotional exhaustion and personal accomplishment and moderate negative correlation between personal accomplishment and depersonalization. The hospitals must try to reduce emotional exhaustion among nurses by combining young nurses with experienced nurses or providing counselors or encouraging nurses to read, exercise and meditate. Otherwise, emotional exhaustion may lead to depersonalization, less personal accomplishment and ultimately to burnout.

REQUEST FOR FEEDBACK

Dear Readers

At the very outset, International Journal of Research in Commerce, Economics and Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mails i.e. infoijrcm@gmail.com or info@ijrcm.org.in for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail infoijrcm@gmail.com.

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

Academically yours

Sd/-

Co-ordinator

ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
