CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the areas of Computer Science & Applications; Commerce; Business; Finance; Marketing; Human Resource Management; General Management; Banking; Economics; Tourism Administration & Management; Education; Law; Library & Information Science; Defence & Strategic Studies; Electronic Science; Corporate Governance; Industrial Relations; and emerging paradigms in allied subjects like Accounting; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Rural Economics; Co-operation; Demography; Development Planning; Development Studies; Applied Economics; Development Economics; Business Economics; Monetary Policy; Public Policy Economics; Real Estate; Regional Economics; Political Science; Continuing Education; Labour Welfare; Philosophy; Psychology; Sociology; Tax Accounting; Advertising & Promotion Management; Management Information Systems (MIS); Business Law; Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labour Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; International Relations; Human Rights & Duties; Public Administration; Population Studies; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism & Hospitality; Transportation Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic; Web Design and emerging paradigms in allied subjects.

Anybody can submit the **soft copy** of unpublished novel; original; empirical and high quality **research work/manuscript anytime** in ***M.S. Word format*** after preparing the same as per our **GUIDELINES FOR SUBMISSION**; at our email address i.e. infoijrcm@gmail.com or online by clicking the link **online submission** as given on our website ([FOR ONLINE SUBMISSION, CLICK HERE](#)).

GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: _____

THE EDITOR
IJRCM

Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF.

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

DEAR SIR/MADAM

Please find my submission of manuscript entitled ' _____ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

NAME OF CORRESPONDING AUTHOR:

Designation:
Affiliation with full address, contact numbers & Pin Code:
Residential address with Pin Code:
Mobile Number (s):
Landline Number (s):
E-mail Address:
Alternate E-mail Address:

NOTES:

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:
New Manuscript for Review in the area of (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers**, and **email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

INTRODUCTION**REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure. Sources of data should be mentioned below the table/figure.** It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
 - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
 - Use (ed.) for one editor, and (ed.s) for multiple editors.
 - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
 - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
 - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
 - For titles in a language other than English, provide an English translation in parentheses.
 - The location of endnotes within the text should be indicated by superscript numbers.

PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:**BOOKS**

DO ASIAN STOCK MARKETS INTERACT?

PRASHANT JOSHI
PROFESSOR & HEAD
DEPARTMENT OF MANAGEMENT
UKA TARSADIA UNIVERSITY
BARDOLI

ABSTRACT

The paper attempts to analyze long-term relationships among major stock markets of Asia namely India, China, Hong Kong and Japan using the Johansen and Juselius multivariate cointegration approach during Jan 2010 to June 2014. Short-run dynamics are captured through vector error correction models. The analysis reveals that there is an evidence of cointegration among the markets demonstrating that stock prices in the countries studied here share a common trend. The results reveal that the speed of adjustment of Indian stock market is higher than other stock markets of Asia.

KEYWORDS

stock market, asian markets, finance.

1. INTRODUCTION

The issue of stock market integration and comovements of stock prices across economies has received considerable attention in economic literature. Integration is the process by which markets become open and unified so that participants in one market have an unimpeded access to other markets. The financial market's integration in general implies that in absence of administrative and informational barriers, risk adjusted returns on assets of the same tenor in each segment of the market should be comparable to one another.

Recent globalization and free movements of capital across boundaries of nation have integrated financial market worldwide. Technological innovations have improved market integration. Careful examination of international stock market movements in recent years suggests that there exists a substantial degree of interdependence among national stock markets. It is argued that unexpected development in international stock markets seem to have become important "news" that influences domestic stock markets (Eun & Shim, 1989).

With the automation and liberalization of the Indian stock markets, there has been a perceptible change in the Indian Stock market towards the later part of the 1990s. Trading system in Bombay Stock Exchange (BSE) and National Stock Exchange (NSE) has reached a global standard. It has created a nationwide trading system that provides equal access to all investors irrespective of geographical location. In that sense, technology has brought about equality among the investors across the country. The stock markets introduced the best possible systems; practiced in advanced stock markets like electronic trading system, rolling settlement in place of the account period settlement, increase in trading hour, dematerialization of shares and introduction of derivatives etc. The focus on the external sector has prompted many Indian companies, especially those in the area of information technology, to list at the US stock exchanges. With the introduction of advanced practices, transparency has also increased in the stock market. Further, among the significant measures of opening up of capital market, portfolio investment by foreign institutional investors (FIIs) such as pension funds, mutual funds, investment trusts, asset management companies have made the turning point for the Indian stock markets. With the financial sector reforms initiated in 1991, not only FIIs and NRIs are allowed to invest in Indian stock markets, Indian corporate have been allowed to tap the global market with global depository receipts (GDR), American depository receipts (ADR) and foreign currency convertible bonds (FCCB) since 1993. All these changes have led to substantial improvement in market capitalization, liquidity and efficiency of the Indian capital market.

The deregulation and market liberalization measures and the increasing activities of multinational companies have accelerated the growth of Indian stock market. Thus, given the newfound interest in the Indian stock markets during liberalization period, it is interesting to know integration of Indian stock markets. The financial markets, especially the stock markets, for developing and developed markets have now become increasingly integrated despite the uniqueness of the specific market and country profile. This has happened specifically due to financial liberalization adopted by most of the countries around the world, technological advancement in communications and trading systems, introduction of innovative financial products and creating more opportunities for international portfolio investments. This has intensified the curiosity in exploring international market linkages.

Eun and Shin (1989) detected the presence of substantial amount of interdependence among national stock markets of USA, UK, Canada, Germany, Australia, France, Japan, Switzerland and Hongkong. Using daily closing price data during the period January 1980 through December 1985, the study found a substantial amount of multi-lateral interactions among the national stock markets. The analysis indicated that innovations in the U.S. were rapidly transmitted to other markets in a clearly recognizable fashion, whereas no single foreign market can significantly explain the U.S. market movements.

Over the past 40 years, stock market prices have been analyzed using different methods and data sets by investors and researchers with an objective to determine the forecastability of price changes. Chung and Ng (1991) have shown that developments in the U.S. market have significant influence on return of Tokyo stock market on the next day, but Tokyo stock market of Japan does not influence the returns of U.S. market. Given the U.S.'s dominant economic and political strength in the world market, this finding does not seem surprising. However, the recent leading role of other stock markets of the world and their interactive participation in the U.S. may possibly signal a reversal of the widely-held notion that the spillover stock market effect is solely from the U.S. to other stock markets.

Bhattacharya and Samantha (2001) investigated the extent to which news on NASDAQ helped price formation at the beginning and at the end of a trading day at the Indian bourses using daily data of stock price indices from January 3, 2000 to October 31, 2000. They analyzed the impact of NASDAQ on SENSEX through Ordinary Least Square (OLS) equations under cointegration and error correction framework¹. The study showed that the news on NASDAQ had played an important role in price formation at the beginning of the new trading day at the Indian bourses. Thus, the study suggested the integration of the Indian capital market with the US market.

Wong, Agrawal and Du (2004) investigated the long-run equilibrium relationship and short-run dynamic linkage between the Indian stock market and the stock markets in major developed countries (United States, United Kingdom and Japan) after 1990 using the Granger causality and cointegration method. Using weekly closing prices data from January 1, 1991 to December 31, 2003, they found that Indian stock market was integrated with mature markets.

Compared to other emerging stock markets in Asia, the Indian stock market has been recognized as relatively less sensitive to changes of Asian and other developed markets of the world. Therefore, in spite of the fact that Indian stock market has largest number of listed companies, it has received little attention while undertaking studies on interconnectedness of world stock markets. Researchers have rarely included the Indian Stock Market while studying the influence of the U.S. markets on Asian markets and interdependence among Asian stock markets (Wong & Ng, 1992, Ng, 2002). These researches are evidences that Indian stock market has not only received relatively less attention of scholars and researchers in the field of international finance but also the market is considered to be somewhat isolated from international markets.

¹In Cointegration, a linear combination of two series, each of which is integrated of order one, is cointegrated of order zero. Error Correction Model is a time series model in first differences that contains an error correction term which works to bring two I(1)(the series that can be transformed into stationary by taking first difference) series back into long-run equilibrium.

Ahmad, Ashraf and Ahmed (2005) examined the interlinkages and causal relationship between the Nasdaq composite index in the US, the Nikkei in Japan with that of NSE Nifty and BSE Sensex in India using daily closing data from January 1999 to August 2004. The study used Granger Causality and Johansen cointegration² methods to examine short run and long term relationship among the stock markets respectively. The results of Co-integration test revealed that there was no long-term relationship of the Indian equity market with that of the US and Japanese equity markets. Granger causality test suggested that there was a unidirectional relationship from Nasdaq and Nikkei to Indian stock markets.

Hoque (2007) explored the dynamics of stock price movements of an emerging market such as Bangladesh with that of USA, Japan and India using daily closing price data starting from January 1, 1990 to December 31, 2000. The indices used for Bangladesh, India, Japan and USA were Dhaka Stock Exchange(DSE) All Share Price Index, BSE30, Nikkei 225 and S&P500 respectively. They analyzed the long term relationships among the markets using the Johansen multivariate cointegration approach and short-term dynamics were captured through vector error correction models. Vector Auto Regression³ was used to study the impact of shocks of these markets on own markets and other markets. The analysis showed that there was evidence of long term cointegration among the markets suggesting that stock prices in the countries share a common stochastic trend. Impulse response analysis shows that shocks to US market do have an impact on Bangladesh stock market. The response of Bangladesh stock market to shocks Indian stock market is weak. Shocks to Japanese stock market do not generate a response in the Bangladesh stock market.

Our literature review suggests that there are few studies on integration of Indian stock markets with developed and developing stock markets of Asia. With liberalization in India, changes in the economic environment of the world and growing interdependence, other countries like India, China, Japan and Hongkong etc, it is interesting to investigate the integration of stock price movements of India with respected to developed and developing stock markets of Asia. The purpose of the paper is to provide such analysis with a special emphasis on integrating relationship of selected stock markets.

The organization of the paper is as follows. Section 2 discusses research design. Results are presented in section 3. Section 4 summarizes.

2. RESEARCH DESIGN

2.1 SAMPLE AND PERIOD OF STUDY

The study uses data on daily closing price of Sensex of India, Shanghai Stock exchange of China, Henseng of Hongkong and Nikkei of Japan starting from 1st January 2010 to 1st June, 2014. Many changes took place during the period like introduction of rolling settlement, transactions in futures and options, the bull run and the highs in the indices, increased FII inflows across the world stock markets, gradual lifting of restrictions on capital flows and relaxation of exchange controls in many countries etc. These changes might have influenced the degree of comovement among the stock markets. It will be instructive to examine the cointegration of the stock markets.

2.2 METHODOLOGY

Daily returns are identified as the difference in the natural logarithm of the closing index value for the two consecutive trading days. It can be presented as:

$$R_t = \log(P_t / P_{t-1}) \quad \text{or} \quad R_t = \log(P_t) - \log(P_{t-1}) \quad \text{Equation 1}$$

Where R_t is logarithmic daily return at time t . P_{t-1} and P_t are daily prices of an asset at two successive days, $t-1$ and t respectively.

2.2.1 UNIT ROOT TEST

Augmented Dickey-Fuller (ADF) test is employed to test the validity of market integration hypothesis. A unit root test is a statistical test for the proposition that in an autoregressive statistical model of a time series, the autoregressive parameter is one. It is a test for detecting the presence of stationarity in the series. The early and pioneering work on testing for a unit root in time series was done by Dickey and Fuller (Dickey and Fuller 1979 and 1981). If the variables in the regression model are not stationary, then it can be shown that the standard assumptions for asymptotic analysis will not be valid. In other words, the usual "t-ratios" will not follow a t-distribution; hence they are inappropriate to undertake hypothesis tests about the regression parameters.

Stationarity time series is one whose mean, variance and covariance are unchanged by time shift. Nonstationary time series have time varying mean or variance or both. If a time series is nonstationary, we can study its behaviour only for a time period under consideration. It is not possible to generalize it to other time periods. It is, therefore, not useful for forecasting purpose.

The presence of unit root in a time series is tested with the help of Augmented Dickey-Fuller Test. It tests for a unit root in the univariate representation of time series. For a return series R_t , the ADF test consists of a regression of the first difference of the series against the series lagged k times as follows:

$$\Delta r_t = \alpha + \delta r_{t-1} + \sum_{i=1}^p \beta_i \Delta r_{t-i} + \varepsilon_t \quad \text{Equation 2}$$

$$\Delta r_t = r_t - r_{t-1}; r_t = \ln(R_t)$$

The null hypothesis is $H_0: \delta = 0$ and $H_1: \delta < 1$. The acceptance of null hypothesis implies nonstationarity.

We can transform the nonstationary time series to stationary time series either by differencing or by detrending. The transformation depends upon whether the series are difference stationary or trend stationary.

2.2.2 CO-INTEGRATION TEST

The purpose of the co-integration test is to determine whether a group of nonstationary series is co-integrated or not. The presence of cointegrating relation forms the basis of the Vector Error Correction (VEC) model specification. The test for the presence of cointegration is performed when all the variables are non-stationary and integrated of the same order. Cointegration exists for variables means despite variables are individually nonstationary, a linear combination of two or more time series can be stationary and there is a long-run equilibrium relationship between these variables. In the present study, we use method proposed by Johansen (1991). This method can be explained by considering the following general autoregressive representation for the vector Y .

$$Y_t = A_0 + \sum_{j=1}^p A_j Y_{t-j} + \varepsilon_t \quad \text{Equation 3}$$

where Y_t is a $n \times 1$ vector of nonstationary variables, A is a $n \times 1$ vector of constants, p is the number of lags, A_j is $n \times n$ matrix of coefficients and ε is assumed to be a $n \times 1$ vector of Gaussian error terms.

In order to use Johansen's test, the above vector autoregressive process can be reparametrized and turned into a vector error correction model of the form:

$$\Delta Y_t = A_0 + \sum_{j=1}^{p-1} \Gamma_j \Delta Y_{t-j} + \Pi Y_{t-p} + \varepsilon_t \quad \text{Equation 4}$$

where

² It is applied when series are non stationary and integrated of the same order. The purpose of the test is to determine whether a group of non-stationary series is co-integrated or not.

³ A model for two or more time series where each variable is modeled as a linear function of past values of all variables plus disturbances that have zero means given all past values of the observed variables.

$$\Gamma_j = -\sum_{i=j+1}^p A_j \quad \text{and} \quad \Pi = -I + \sum_{i=j+1}^p A_j$$

Equation 5

Δ is the difference operator and I is nxn identity matrix.

The issue of potential cointegration is investigated when we compare the both sides of equation 4. As Y_t is integrated of order 1 i.e. $I(1)$, ΔY_t is $I(0)$, so are ΔY_{t-j} .

This implies that left-hand side of equation 4 is stationary since ΔY_{t-j} is stationary; the right hand side of equation 4 will also stationary ΠY_{t-p} is stationary. The Johansen test centres on an examination of the Π matrix. The Π can be interpreted as a long run coefficient matrix. The test for cointegration between the Y 's is calculated by looking at the rank of the Π matrix via eigenvalues. The rank of the matrix is equal to the number of its characteristic roots (eigenvalues) that are different from zero. The information on coefficient matrix between the levels of the Π is decomposed as $\Pi = \alpha\beta$, where the relevant elements, the α matrix are adjustment coefficients and β matrix contains the cointegrating vectors.

There are two test statistics for cointegration under the Johansen method to test for number of characteristic roots. There are trace and the maximum eigenvalues test:

$$\lambda_{trace}(r) = -T \sum_{i=r+1}^g \ln(1 - \hat{\lambda}_i)$$

Equation 6

and

$$\lambda_{max}(r, r+1) = -T \ln(1 - \hat{\lambda}_{r+1})$$

Equation 7

where $\hat{\lambda}$ is the estimated values of the characteristic roots obtained from the estimated Π matrix, T is the number of usable observations and r is the number of cointegrating vectors.

The trace test statistics, test the null hypothesis that the number of distinct cointegration vectors is less than or equal to r against the alternative hypothesis of

more than r cointegrating relationships. From the above, it is clear that λ_{trace} equals zero when all $\hat{\lambda} = 0$. The maximum eigenvalue statistics test the null hypothesis that the number of cointegrating vectors is less than or equal to r against the alternative of $r+1$ cointegrating vectors.

Johansen and Juselius (1990) provided critical values for the two statistics. If the test statistics is greater than the critical value from Johansen's table, reject the null hypothesis in favour of the alternative hypothesis discussed above.

2.2.3 SHORT-RUN DYNAMICS OF THE SYSTEM

Short run dynamics of the system is examined through error correction model. The discussion on the model is given in the following section.

2.2.3.1 ERROR CORRECTION MODEL

If variables are nonstationary and are cointegrated, the adequate method to capture short run dynamics is Vector Error Correction Models (VECMs). It examines the responses of a variable to changes and innovations in other variables and the adjustments that it takes to correct for any deviations from the long-run equilibrium relationship. Under cointegration, the VECM can be written as:

$$\Delta Y_t = \alpha\beta'Y_{t-1} + \sum_{i=1}^{k-1} \Gamma_i \Delta Y_{t-i} + A_t + \epsilon_t$$

Equation 8

where α is the matrix of adjustment or feedback coefficients, which measures how strongly deviations from equilibrium, the r stationary variables $\beta'Y_{t-1}$, feedback into the system. If there are $0 < r < p$ cointegrating vectors, then some of the elements must be non zero.

3. RESULTS AND DISCUSSION

A prerequisite for testing cointegration between the stock indices is the all variables are non-stationary. The first phase in the estimation process is deciding the order of integration of the individual price index series in natural log levels. The log of the indices, denoted as LSensex, LSSE, LHSI and LNIKKEI are tested for unit roots using the Augmented Dickey-Fuller (ADF) test using lag structure indicated by Schwarz Bayesian Information Criterion (SBIC). The results of the Augmented Dickey Fuller test for unit root test are given in Table 1. It shows that all the variables are non-stationary at their log level. However, they are stationary at their first difference and are integrated of order one as the actual values reported in the Table 1 exceed MacKinnon 's critical values of -3.43, -2.86 and -2.56 at 1%, 5% and 10% levels respectively. Thus, all the series under investigation are $I(1)$. This means that all the series are individually integrated.

TABLE 1: UNIT ROOT TEST

Stock markets	Log Level	First Difference of Logarithmic series
LSensex	-0.768 (0.830)	-31.018 (0.000)
LSSE	-1.936 (0.314)	-33.078 (0.000)
LHSI	-2.58 (0.097)	-32.555 (0.000)
LNIKKEI	-0.579 (0.872)	-34.038 (0.000)
LSP500	-2.293 (0.174)	-56.350 (0.000)

Johansen cointegration test is sensitive to the lag length(Enders, 2004). We employ AIC criteria to select the lag length to include in the analysis. Here, AIC selects the model with 2 lag.

The second phase involves an assessment on the five market series for cointegration. The cointegration test is to determine whether or not the five nonstationary price indices share a common stochastic trend. Table 2 presents the results of cointegration tests pertaining to the indices. The results reveal the presence of significant cointegrating relationships between the stock market indices under investigation. Both the λ_{trace} and λ_{max} test show two significant cointegrating ranks. This indicates the presence of long-run equilibrium relations between the India, China, Hongkong and Japan stock markets. In other words, by and large all the stock indices are moving together.

TABLE 2: JOHANSEN'S COINTEGRATION TEST RESULTS FIVE INDICES

λ_{trace}				
Hypothesized		Trace		
No. of CE(s)	Eigenvalue	Statistic	Critical Value	Prob.**
None *	0.038957	77.98779	54.07904	0.0001
At most 1	0.020570	34.83410	35.19275	0.0446
At most 2	0.009231	12.26181	20.26184	0.4256
At most 3	0.002015	2.190039	9.164546	0.7397
At most 4	0.038957	77.98779	54.07904	0.0001
λ_{max}				
Hypothesized		Max-Eigen	0.05	
No. of CE(s)	Eigenvalue	Statistic	Critical Value	Prob.**
None *	0.038957	43.15369	28.58808	0.0004
At most 1 *	0.020570	22.57229	22.29962	0.0458
At most 2	0.009231	10.07177	15.89210	0.3279
At most 3	0.002015	2.190039	9.164546	0.7397
At most 4	0.038957	43.15369	28.58808	0.0004
Max-eigenvalue test indicates 2 cointegrating eqn(s) at the 0.05 level				
* denotes rejection of the hypothesis at the 0.05 level				
**MacKinnon-Haug-Michelis (1999) p-values				

*Figure in the parenthesis are t-statistics.¹The cointegrating vector is normalized on the NSE stock index.

The model adequacy test of Johansen cointegration is tested using Portmanteau test for autocorrelations. The result of the test at lag length is tabulated as below:

TABLE 3: PORTMANTEAU TEST FOR AUTOCORRELATION

Lags	Q-test	Prob	Adj. Q test	Prob	Df
5	90.51	0.08	90.82	0.076	45

The result suggests no residual autocorrelation after the model is fit. It implies that the model is adequate to capture the cointegration among the stock markets.

The second phase involves estimation of five error correction equations, based on cointegrated model. Table 5 represents the results of VECM. It is used to examine the short run equilibrium dynamics of the stock indices.

TABLE 3: RESULTS OF VECM MODEL

Error Correction:	D(LSensex)	D(LSSE)	D(HSI)	D(LNIKKEI)
ECM(-1)	0.052583	0.006214	-0.014029	0.089022
	[-1.986]*	[0.9087]	[-0.4789]	[3.8289]

*Indicates t-statistics

The results suggest that the error correction terms or adjustment coefficients are statistically significant for Sensex. The speed of adjustment coefficients is low in magnitude. It can be seen from the Table 4 that the coefficients of error correction terms of all stock markets except Sensex and SSE are negative. For instance, the positive coefficient of (0.005) of the cointegrating relation in the Sensex equation means that the return of the underlying goes up when the cointegrating equation shows positive values (direct relationship). The negative coefficients indicate that the returns of the stock markets go down when the cointegrating equation shows positive values (inverse relationship). The speed of adjustment of Indian stock market is marginally higher than rest of the stock markets. The results in the table 4 suggest that Indian stock market goes back to equilibrium faster.

4. SUMMARY

The present stud endeavored to explore the dynamics of stock price co-movements of USA, India, China, Hong Kong and Japan stock markets. Cointegration model is used to examine the long-run equilibrium relationship among the time series. The results demonstrate that stock prices in those countries share a common trend. In general long-term relationship and short-term dynamics have been detected in this study.

The existence of market integration among the stock indices under investigations indicates that diversification among these five markets leads to little benefit to international portfolio investors. The results have several policy implications. If the markets are integrated, arbitrage opportunities would be very low. The absence of arbitrage opportunity may lead to low level of speculation leads to better market efficiency and the return would be proportionate to the risk.

The speed of adjustment of Indian stock market is higher implying it absorbs news faster than other stock markets and it is considered to be more informationally efficient than other stock markets.

REQUEST FOR FEEDBACK

Dear Readers

At the very outset, International Journal of Research in Commerce, Economics & Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail infoijrcm@gmail.com for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail infoijrcm@gmail.com.

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

Academically yours

Sd/-
Co-ordinator

ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
