CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the area of Computer, Business, Finance, Marketing, Human Resource Management, General Management, Banking, Insurance, Corporate Governance and emerging paradigms in allied subjects like Accounting Education; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Monetary Policy; Portfolio & Security Analysis; Public Policy Economics; Real Estate; Regional Economics; Tax Accounting; Advertising & Promotion Management; Business Education; Management Information Systems (MIS); Business Law, Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labor Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; Public Administration; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism, Hospitality & Leisure; Transportation/Physical Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Digital Logic; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Multimedia; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic and Web Design. The above mentioned tracks are only indicative, and not exhaustive.

Anybody can submit the soft copy of his/her manuscript **anytime** in M.S. Word format after preparing the same as per our submission guidelines duly available on our website under the heading guidelines for submission, at the email address: infoijrcm@gmail.com.

GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: _____

THE EDITOR
IJRCM

Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF _____.

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

DEAR SIR/MADAM

Please find my submission of manuscript entitled ' _____ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

NAME OF CORRESPONDING AUTHOR:

Designation:

Affiliation with full address, contact numbers & Pin Code:

Residential address with Pin Code:

Mobile Number (s):

Landline Number (s):

E-mail Address:

Alternate E-mail Address:

NOTES:

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:
New Manuscript for Review in the area of (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers**, and **email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

INTRODUCTION**REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure. Sources of data should be mentioned below the table/figure.** It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
 - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
 - Use (ed.) for one editor, and (ed.s) for multiple editors.
 - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
 - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
 - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
 - For titles in a language other than English, provide an English translation in parentheses.
 - The location of endnotes within the text should be indicated by superscript numbers.

PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:**BOOKS**

- Bowersox, Donald J., Closs, David J., (1996), "Logistical Management." Tata McGraw, Hill, New Delhi.

ABSTRACT

Soft computing forecasting tools play an important role to forecast many complicated systems. In this paper, an effort has been made to use soft computing approaches to predict Dhaka daily temperatures for the period of 28 February 1945 to 27 August 2006. We have selected the fuzzy neuro model, the neuro genetic algorithm model as soft computing techniques. To compare results, a popular time series statistical technique, namely autoregressive integrated moving average model is selected and based on error analysis, a suitable model to predict temperature for the Dhaka city is proposed. The performance comparisons of different models due to root mean square error, correlation coefficient and coefficient of determination between observed and predicted temperatures indicate that the neuro genetic algorithm model predicts temperatures with maximum accuracy, followed by the fuzzy neuro model. Our believe findings of this paper will be useful for those who are interested about Bangladeshi important atmospheric parameter, namely temperature.

KEYWORDS

Artificial neural network, Genetic algorithm, Prediction, Soft computing, Statistical error measures.

1. INTRODUCTION

Forecasting is a technique of knowing what may happen to a system when certain conditions continue (or continue to change). In recent years, soft computing techniques are being increasingly used for forecasting systems. For examples, see Mandal et al (2008), Zhang and Knoll (2001), Chaudhuri and Chattopadhyay (2005) and others. These techniques have opened up new avenues to the forecasters of complex systems. The basic philosophy of these techniques is that they build prediction systems from input-output patterns directly without using any prior information. Soft computing models composed of fuzzy logic, neural network, genetic algorithm etc. Over the years, the application of neural network in various areas (Cook and Wolfe (1991), Dawson and Wilby (1998) and others) has been growing in acceptance. Given sufficient input-output data, this network is able to approximate any function to arbitrary accuracy. Fuzzy logic is another area that has been applied successfully in recent years (Nayak et al. (2005), Singh (2007) and others). Another area of soft computing is genetic algorithm (GA) (Maritza (2009), Sen and Oztopal (2001) and others), is a global search algorithm based on the principle of 'survival of the fittest'. Most of times, these three components are combined in different ways to form models like fuzzy-neuro model, neuro-GA model etc. In literature, all of these combinations are widely used in prediction of systems. For example, neural network and fuzzy logic models are proven to be effective when used on their own, the individual strengths of each approach have been integrated to construct a powerful intelligent system called neuro fuzzy system. Many researchers have (Nayak et al (2004), Dounis et al. (1997) and others) applied an adaptive neuro fuzzy inference system (ANFIS) for many systems modeling. The results were highly promising and a comparative analysis suggests that ANFIS outperforms than the independent neural network and the fuzzy logic models in terms of computational speed, forecast errors, efficiency etc. On the other hand, merging of GA and neural network will lead to significantly better intelligent systems than relying on neural network or GA alone (Khan et al. (2008), Lin (2004) and others). This means, find first a neural network model and then update the model using GA. The purpose of this paper is to forecast important meteorological parameter namely temperature using soft computing methodologies. It is well known that prediction of meteorological variable temperature is very important because it affects our daily lives in many ways. For example, forecasts based on temperature is important for agricultural planning, water resources management and also forecasting other important meteorological variables like rainfall, humidity wind speed etc. Temperature forecasts are used by utility companies to estimate their demands over coming days. Forecasting with 100% accuracy may be impossible, but we can do our best to reduce forecasting errors. To solve forecasting problems, many researchers (Chaudhuri and Chattopadhyay (2005), Nayak et al (2005), Maritza (2009) and others) have proposed soft computing models. This paper presents a comparative study of soft computing models, namely neuro-fuzzy model, neuro-GA model and a statistical model to forecast temperature of Dhaka city. Other meteorological variables are left for future research. We have chosen the autoregressive integrated moving average model as a statistical model. The reason is to choose this model for small forecasting errors and efficiency than other time series statistical models. Mounting empirical works (Chaudhuri and Chattopadhyay (2005), Maritza (2009), Denis et al (1997) and many others) have been carried out to forecast temperatures using various forecasting models in context of various countries. Although studies (Mondal and Shahid (2004) and others) have been conducted to predict temperature for other cities of Bangladesh, to our knowledge, no comparative work is available to predict temperature under the soft computing models for the Dhaka city. We have considered this issue in this paper, which is planned as follows: The next section explains data series and data properties. The methods used to forecast temperature for Dhaka city is described in section 3. We provide evaluation criteria and our experimental results in section 4. Finally, conclusions and some suggested future works are given in Section 5.

2. DATA

Data under investigation are the daily minimum (MinTem) and maximum (MaxTem) temperatures of the Dhaka city (collected from: ftp://ftp.ncdc.noaa.gov/pub/data/ghcn/v2), over the period of 28 February 1945 to 27 August 2006 for a total of 6469 observations. The data sets are shown in Figure 1. To understand behaviors of the MinTem and MaxTem variables, summary statistics are reported in Table 1. For example, mean and SD for MinTem shows us minimum temperatures are ranging 16.8°C to 27°C. Skewed and kurtosis measures indicate that temperatures pattern do not follow the normal distribution.

FIGURE 1: TIME PLOTS OF MINIMUM AND MAXIMUM DHAKA CITY TEMPERATURES

TABLE 1: SUMMARY STATISTICS OF DHAKA CITY TEMPERATURE

| Statistics | MinTem (°C) | MaxTem(°C) |
|--------------------|-------------|------------|
| Mean | 21.9 | 30.6 |
| Standard deviation | 5.1 | 3.4 |
| Skewness | -0.66 | -0.53 |
| Kurtosis | 2.21 | 3.28 |

Various methods for forecasting when series is linear or non-linear are available in literature. The method, a forecaster chooses depends upon the experience of the forecaster, the amount of information available to the forecaster and the degree of accuracy or confidence needed in the forecast. To select appropriate forecasting method, first we have selected statistical diagnostic tests to ‘diagnose’ problems with the model (see the next section) that we are using for forecasting. These tests are based on the ordinary least square method residuals. The statistical test proposed by Engle (1982) is used to test the presence of non-linear dependence. In addition, normality test proposed by Jarque-Bera (1980) and serial correlation test proposed by Ljung-Box (1978) are applied to

TABLE 2: DIAGNOSTIC TESTS RESULTS AT THE 5% SIGNIFICANCE LEVEL

| Statistics | MinTem (°C) | MaxTem(°C) |
|---------------------------|-------------|------------|
| Jarque and Bera Statistic | 50.7079 | 31.2763 |
| p-value | 0.0000 | 0.0000 |
| Ljung and Box Statistic | 56.57 | 43.56 |
| p-value | 0.0000 | 0.0000 |
| Engle statistic | 59.79 | 45.09 |
| p-value | 0.0000 | 0.0000 |

see whether other important noises (peculiarities) such as non-normality and series correlation are present in the series or not. Details of the diagnostic test procedures see Thomas (1997). Diagnostic test results are tabulated in Table 2. We found that the Engle test exhibits nonlinearities in temperatures. The Jarque-Bera test rejects the null hypothesis of normality. According to the Ljung-Box statistic, there is no relevant autocorrelation for temperatures.

3. TECHNIQUES USED TO PREDICT TEMPERATURE

Since Table 2 tests results show us that the chosen variables are non-linear, we have selected non-linear forecasting techniques to forecast minimum and maximum temperatures for the Dhaka city station. The following most popular soft computing techniques are chosen, which composed of fuzzy logic, neural network and genetic algorithm:

- (a) Fuzzy neuro model
- (b) Neuro genetic algorithm model

All of this combination is widely used in prediction of time series data (Nayak et al. (2004), Dounis et al. (1997), Khan et al. (2008), Lin (2004)). To compare results, beside these techniques, we have selected a popular statistical technique, namely autoregressive integrated moving average time series technique. A brief description of the above popular selected models is described below:

3.1 FUZZY NEURO MODEL

The basic concept comprises the neural approach, fuzzy theory such as fuzzy set, membership functions and fuzzy if-then inference rules. That means it is a combination of two intelligence systems: (i) fuzzy inference system and (ii) neural network system, where neural network learning algorithm is used to determine parameters of fuzzy inference system. It is the first integrated hybrid neuro-fuzzy model, introduced by Jang (1993) and is referred to literature as adaptive network based fuzzy inference system (ANFIS). This system has 5 layers: (i) 1 input layer (ii) 3 hidden layers that represents mfs and fuzzy rules and (iii) 1 output layer. See Jang (1993) for its architecture. First, it uses the training data set to build the fuzzy system in which membership functions are adjusted using the back-propagation algorithm, allowing that the system learns with the data that it is modeling. The membership function patterns used for the input series are of triangular shape, trapezoidal shape, Gaussian shape, sigmoidal shape and others. The fuzzy inputs with their associated membership functions form inputs to the neural network, which processed through a transfer functions (such as hard limit, linear, pureline, transig, logsigmoid, sigmoid) at the nodes of different layers of the network to obtain output. The learning algorithm of ANFIS is a hybrid algorithm, which combines the gradient descent (GD) method and the least square estimation (LSE) for an effective search of parameters. ANFIS uses a two pass of learning algorithm to reduce error: (i) forward pass and (ii) backward pass. The hidden layer is computed by the GD method of the feedback structure and the final output is estimated by the LSE method (details, see Jang (1993)).

3.2 NEURO GENETIC ALGORITHM MODEL

We used GA based neural network model. The steps are as follows:

- (i) Construct first artificial neural network architecture by error and trial method.
- (ii) Extract weights for the above network by implementing genetic algorithm i.e. construct a back-propagation network with GA (ANN-GA).
- (iii) Train the ANN-GA network with different parameter values of population.
- (iv) Find the best parameter value from the selected population parameters values to forecast temperatures.

A brief description of ANN and GA methodologies is given below.

3.2.1 ARTIFICIAL NEURAL NETWORK MODEL

It is introduced by Culloch (1943) consists the following processing functions: (i) Receiving inputs (ii) Assigning appropriate weight coefficients of inputs (iii) Calculating weighted sum of inputs (iv) Comparing this sum with some threshold and finally (v) Determining an appropriate output value. An ANN structure has 1 input layer, two hidden layers (with sufficient no. of neurons) and 1 output layer. See Culloch (1943) for its architecture. The training algorithm is the standard back-propagation, which uses the GD technique to minimize error. During training, each estimated temperature is compared with the actual temperature and calculates error at the output layer. The backward pass is the error back-propagation and adjustments of weights. Thus, the network is adjusted based on a comparison of output and the target until the network output matches the target. When the training process is completed, then the network with adjusted estimated parameters is used to test a set of data, which is different from the training set of data. For details, see Culloch (1943) and Banik et al. (2012).

3.2.2 GENETIC ALGORITHM MODEL

This technique is proposed by Holland (1975). It is a computerized search and optimization algorithm based on the mechanics of natural genetics and natural selection. It operates on a population of individuals which represent solution for a given problem.

3.2.2.1 GENETIC TERMS

It involves the following terms:

Chromosomes – Population characteristics.

Population- A set of solutions represented by chromosomes.

Fitness function - It measures the performance of the system. The fitness function to be evolved is problem dependent. For prediction and estimation problem, the function will be root mean square error, coefficient of determination etc.

3.2.2.2 GENETIC OPERATORS

It consists of three operators:

Reproduction – It is also known as selection operator is used to select the best chromosomes for parents from population.

Crossover - Basic operator for producing new (improved) chromosomes is known as crossover (a version of artificial mating). It produces offspring that have some parts of both parents genetic material. Offspring are produced using the intermediate crossover method, because this is a method proposed to recombine of parents with real valued chromosomes.

Mutation - Offspring are mutated after being produced crossover offspring and this GA operator increases the chance that the algorithm will generate better fittest MSE (for example) than the GA crossover operator. For details of the GA procedures, see Holland (1975) and Banik et al. (2009).

Thus, we developed a GA based ANN system, which is a neuro-genetic hybrid approach, where GA is used to determine the weights of a multilayer network with the back propagation learning.

3.3 AUTOREGRESSIVE INTEGRATED MOVING AVERAGE MODEL

In statistics, traditionally, a time series forecasting problem is tackled using the technique Autoregressive Integrated Moving Average (ARIMA) model introduced by Box and Jenkins (1976). We have chosen this method, because it is a very popular statistical method, which is widely used to forecast time series data in time series literature. General form of an ARIMA(p,d,q) can be written as follows, where p is the autoregressive order, d is the integration order and q is the moving average order:

$$Temp_t = \text{const} \tan t + \sum_{i=1}^p a_i Temp_{t-i} + \sum_{j=1}^q b_j e_{t-j} + e_t, \quad t = 1, 2, \dots, n$$

where Temp_t is the observed temperatures, a_i denotes autoregressive coefficients, b_j denotes moving average coefficients and e_t is a white noise disturbances term.

In this paper, an effort has been made to predict temperatures for the Dhaka city applying methods (3.1)-(3.3). Finally, based on the error analysis, suitable models have been recommended to predict temperatures for the Dhaka city.

The functional patterns for forecasting models of MinTem and MaxTem variables are as follows:

$$\text{MinTem}_t = f(\text{lag values of MinTem}_{t-i}), \quad i = 1, 2, \dots, p$$

$$\text{MaxTem}_t = f(\text{lag values of MaxTem}_{t-i}), \quad i = 1, 2, \dots, p$$

where p is the lag order chosen by the selected forecasting models. Our target is to estimate the above models parameters using the techniques of ANFIS, GA-ANN and ARIMA.

4. EVALUATION CRITERIA AND EXPERIMENTAL RESULTS

4.1 EVALUATION CRITERIA

The comparison and the evaluation of the selected models are done according to their predictions using the following statistical estimators:

- (i) Root mean square error (RMSE)
- (ii) Coefficient of correlation (ρ)
- (iii) Coefficient of determination (R²)

These are defined as follows:

$$RMSE = \sqrt{\frac{\sum_{i=1}^n (O_i - P_i)^2}{n}}$$

$$\rho = \frac{\sum_{i=1}^n (O_i - O_{AVG})(P_i - P_{AVG})}{\sqrt{\sum_{i=1}^n (O_i - O_{AVG})^2} \sqrt{\sum_{i=1}^n (P_i - P_{AVG})^2}}$$

$$R^2 = \left[\frac{\sum_{i=1}^n (O_i - O_{AVG})(P_i - P_{AVG})}{\sqrt{\sum_{i=1}^n (O_i - O_{AVG})^2} \sqrt{\sum_{i=1}^n (P_i - P_{AVG})^2}} \right]^2$$

where n = Total no of observations, O_i = observed temperature, P_i = predicted temperature, O_{AVG} = average observed temperature and P_{AVG} = average predicted temperature. RMSE are used to measure the accuracy of prediction through representing the degree of scatter and a smallest value of RMSE indicates higher accuracy in forecasting. Correlation coefficient ρ represents the strength of relation (match between observed and predicted temperatures). R² is a measure of the accuracy of prediction of the trained network models. Higher ρ and R² values indicate better prediction.

4.2. RESULT ANALYSIS

For development of all models for forecasting Dhaka temperatures, MATLAB programming codes are used. The first 50% data are used as the training period and the rest 50% as the testing period. To reduce error, an error and trial approach for MinTem and MaxTem variables is used to find the computational settings for each of selected techniques, which are reported in Table 3. Initially an ANN model is developed and then it is integrated with fuzzy logic to develop an ANFIS model. Further the ANN weights are optimized by genetic algorithm to develop a GA-ANN model. For the accuracy of the ARIMA models, autocorrelation function and partial autocorrelation correlograms are examined (figures are available on request) and the model is obtained is ARIMA(3,1,2) for both MinTem and MaxTem variables. The estimated equations obtained by ARIMA(3,1,2) are as follows:

$$\text{MinTem}_t = 0.3693 + 0.1190\text{MinTem}_{t-1} - 0.8429\text{MinTem}_{t-2} + 0.1186\text{MinTem}_{t-3} + 0.1197e_{t-1} - 0.6040e_{t-2}, t = 1, 2, \dots, n$$

$$\text{MaxTem}_t = 3.2759 + 0.1168\text{MaxTem}_{t-1} + 0.0589\text{MaxTem}_{t-2} - 0.1210\text{MaxTem}_{t-3} - 0.5961e_{t-1} + 0.1139e_{t-2}, t = 1, 2, \dots, n$$

The performance measures used to evaluate the models are RMSE, ρ and R^2 . Results are tabulated in Tables 4-5. The graphical comparison between observed and 3 models predicted temperatures are shown in Figures 2 to 3.

It has been observed that for the MinTem series and for the training data, RMSE obtained from various models lie in the range of 1.8333-2.8300 with the GA-ANN model performing the best with RMSE 1.8333 (i.e. good match between actual and predicted temperatures), followed by ANFIS with RMSE 2.7773. Similarly, it is observed that the GA-ANN predicted temperature matches well with the observed temperature showing a high value of 0.9633 followed by the ANFIS and the ARIMA with R^2 values of 0.9337 and 0.8933 respectively.

For testing data, the RMSE obtained from various model lie in the range of 1.7237-3.8229 with the GA-ANN model performing the best with RMSE 1.7237, followed by ANFIS with RMSE 3.7800. Similarly, we observed that the GA-ANN predicted temperature matches well with the observed temperature showing a high value of 0.9943 followed by the ANFIS and the ARIMA with R^2 values of 0.9454 and 0.9071 respectively.

TABLE 3: ANFIS, GA-ANN AND ARIMA ARCHITECTURE PARAMETERS FOR TEMPERATURE FORECASTING MODELS

| ANFIS | | GA-ANN | | ARIMA | |
|-----------------------------------|----------|-----------------------------------|------------------|------------------------|---|
| No. of Inputs | 6 | No. of input neurons | 10 | No. of AR coefficients | 3 |
| No. of MF | 3 | No. of Hidden neurons | 6 | Integration order | 1 |
| MF type | Gaussian | No. of hidden layers | 2 | No. of MA coefficients | 2 |
| Transfer function of hidden layer | Sigmoid | Learning rate | 0.01 | | |
| Transfer function of output layer | Linear | Transfer function of hidden layer | Sigmoid | | |
| Training algorithm | Hybrid | Transfer function of output layer | Linear | | |
| Training goal | 0.01 | Momentum factor | 0.30 | | |
| | | Training algorithm | Back-propagation | | |
| | | Training goal | 0.01 | | |
| | | Population | 1000 | | |
| | | Generation | 200 | | |
| | | Selection function | Roulette | | |
| | | Crossover rate | 0.90 | | |
| | | Mutation rate | Gaussian | | |

TABLE 4: PERFORMANCE MEASURES OF SELECTED MODELS FOR TRAINING DATA

| Performance Measures | ANFIS | GA-ANN | ARIMA | MinTem | | |
|----------------------|--------|--------|--------|--------|--------|--------|
| | | | | ANFIS | GA-ANN | ARIMA |
| RMSE | 2.7773 | 1.8333 | 2.8300 | 1.89 | 1.5945 | 1.9200 |
| ρ | 0.9662 | 0.9814 | 0.9451 | 0.9930 | 0.9964 | 0.9778 |
| R^2 | 0.9337 | 0.9633 | 0.8933 | 0.9862 | 0.9929 | 0.9561 |

TABLE 5: PERFORMANCE MEASURES OF SELECTED MODELS FOR TESTING DATA

| Performance Measures | ANFIS | GA-ANN | ARIMA | MinTem | | |
|----------------------|--------|--------|--------|--------|--------|--------|
| | | | | ANFIS | GA-ANN | ARIMA |
| RMSE | 3.7800 | 1.7237 | 3.8229 | 5.3200 | 4.4514 | 5.8900 |
| ρ | 0.9723 | 0.9971 | 0.9524 | 0.9241 | 0.9461 | 0.9193 |
| R^2 | 0.9454 | 0.9943 | 0.9071 | 0.8541 | 0.8952 | 0.8452 |

FIGURE 2: ACTUAL AND PREDICTED MINIMUM TEMPERATURES

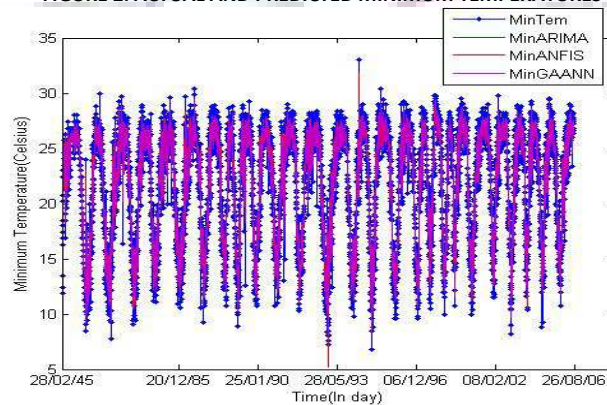

FIGURE 2A: ACTUAL AND PREDICTED MINIMUM TEMPERATURES FOR SOME PERIODS

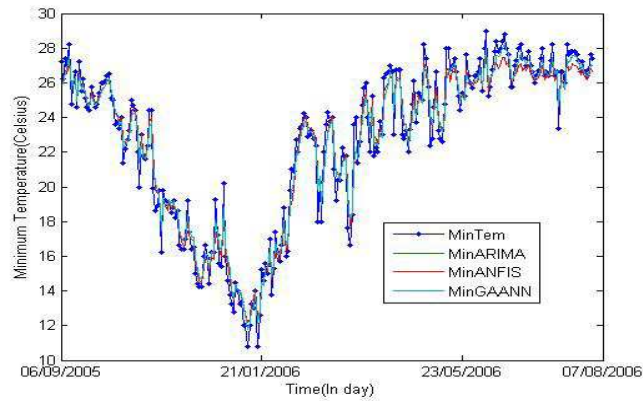

FIGURE 3: ACTUAL AND PREDICTED MAXIMUM TEMPERATURES

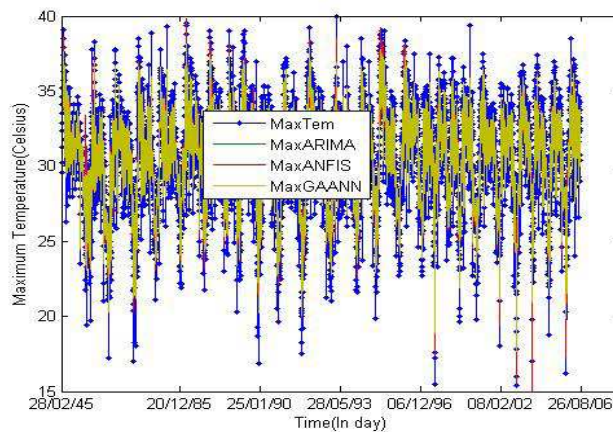

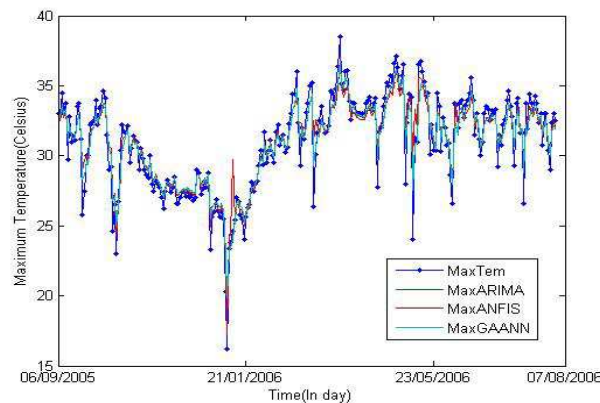

FIGURE 3A: ACTUAL AND PREDICTED MAXIMUM TEMPERATURES FOR SOME PERIODS

As also can be understood from Tables IV-V, compared to the ARIMA and ANFIS, the GA-ANN for the MaxTem series due to RMSE, ρ and R^2 values, can more efficiently capture dynamic behavior of the weather temperature.

In order to see how well our considered models fitted to the actual MinTem and MaxTem, Figure 2 and Figure 3 added, where three selected forecasting models performances are shown with observed temperatures. To avoid the clumsiness of the figures that means for better understanding, we have added Figure 2a and Figure 3a. The graphical comparison between the observed and considered predicted models temperatures follow the trend of the observed graph. However, it is observed that GA-ANN predicted graph matches well as compare to the ANFIS and ARIMA predicted graphs.

5. CONCLUSION

Using soft computing methodologies, this paper modeled important meteorological parameter namely minimum and maximum temperatures for the Dhaka city, which affects our daily lives and decisions in many ways. We developed an adaptive neural fuzzy inference model and a genetic algorithm based neural network model to predict Dhaka city temperatures. To compare performances of the above two soft computing methodologies, a popular statistical forecasting technique namely autoregressive moving average time series model is used. Initially an artificial neural network model is developed and it is then integrated with fuzzy logic to develop an adaptive neural fuzzy inference model. Further the artificial neural network weights are optimized by genetic algorithm to develop a genetic algorithm based on neural network model. The comparison and evaluation for the considered systems are done according to their predictions using several statistical estimators, namely root mean square error, correlation coefficient and coefficient of determination. Our findings suggest that genetic algorithm based neural network model predicts temperature with maximum accuracy as compared to the adaptive neural fuzzy inference model and the selected time series model. The adaptive neural fuzzy inference model and the autoregressive moving average model performances are not same, but the adaptive neural fuzzy inference model predicts temperature better than the autoregressive moving average model. The proposed models in this paper could

also be used to predict other important meteorological variables namely humidity, wind speed etc. which is also very important for many reasons. This is left for future research.

REQUEST FOR FEEDBACK

Dear Readers

At the very outset, International Journal of Research in Commerce, IT and Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail i.e. infoijrcm@gmail.com for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail infoijrcm@gmail.com.

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

Academically yours

Sd/-

Co-ordinator

ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
