CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the area of Computer, Business, Finance, Marketing, Human Resource Management, General Management, Banking, Insurance, Corporate Governance and emerging paradigms in allied subjects like Accounting Education; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Monetary Policy; Portfolio & Security Analysis; Public Policy Economics; Real Estate; Regional Economics; Tax Accounting; Advertising & Promotion Management; Business Education; Management Information Systems (MIS); Business Law, Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labor Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; Public Administration; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism, Hospitality & Leisure; Transportation/Physical Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Digital Logic; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Multimedia; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic and Web Design. The above mentioned tracks are only indicative, and not exhaustive.

Anybody can submit the soft copy of his/her manuscript **anytime** in M.S. Word format after preparing the same as per our submission guidelines duly available on our website under the heading guidelines for submission, at the email address: infoijrcm@gmail.com.

GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: _____

THE EDITOR
IJRCM

Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

DEAR SIR/MADAM

Please find my submission of manuscript entitled ' _____ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

NAME OF CORRESPONDING AUTHOR:

Designation:

Affiliation with full address, contact numbers & Pin Code:

Residential address with Pin Code:

Mobile Number (s):

Landline Number (s):

E-mail Address:

Alternate E-mail Address:

NOTES:

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:
New Manuscript for Review in the area of (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers**, and **email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

INTRODUCTION**REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure. Sources of data should be mentioned below the table/figure.** It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
 - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
 - Use **(ed.)** for one editor, and **(ed.s)** for multiple editors.
 - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
 - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
 - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
 - For titles in a language other than English, provide an English translation in parentheses.
 - The location of endnotes within the text should be indicated by superscript numbers.

PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:**BOOKS**

- Bowersox, Donald J., Closs, David J., (1996), "Logistical Management." Tata McGraw, Hill, New Delhi.

ABSTRACT

Call European Option is a derivative which confers the holder of the instrument the right but not the obligation to buy the underlying asset at strike price on a pre-determined date. Since the writer of the option is at the mercy of the holder, the former is entitled to compensation from the latter. This compensation is called Premium. Premium is also called the price of the option. The prices of call European options are governed by four important factors – strike price, current market price, time to expiry and volatility of underlying stock. This paper seeks to explore the strength of these factors across call European options having the underlying stocks from five major industries individually as well as collectively. Black-Scholes model is the most acclaimed theory in the determination of option prices. This paper also attempts to empirically examine the validity and veracity of that model in terms of whether this model undervalues or overvalues the option prices, and the degree of undervaluation and overvaluation.

KEYWORDS

Black-Scholes model, Call European Options, Current Market Price, Strike Price, time to expiry, Volatility of underlying stock.

INTRODUCTION

The ever increasing interest of humans in increasing the wealth has led to the growth of a fascinating discipline called Financial Engineering. Financial Engineers have continuously involved themselves in churning out new financial instruments with varied risk and return combinations attached to them. One such new type of instrument is *Derivative*. Derivatives are the financial securities whose value is determined from the value of some underlying asset. These are the contracts that are designed to minimize risk for the investors on their investments. Derivatives transfer the risk from those who wish to avoid risk to those who wish to accept the risk. The various derivatives are **Futures and Options**.

Futures refer to agreement between a buyer and a seller to exchange the commodity or instrument for a pre-determined future date at a certain price agreed today. While futures hedge the risk of adverse movement in the price of underlying assets, but they concurrently preclude the writer of futures contract from any favorable movement in the latter. To overcome this drawback, *options* have been evolved.

An *Option* is a financial derivative, which confers a right without obligation, to the holder of the instrument to buy or sell an asset at a specified price called *strike price/exercise price* on or before a certain date. Like Futures contracts, option contracts too are derived from an underlying asset, which could be a security, a commodity, or an index. And like financial futures, financial options are based on financial assets such as shares, indices, bonds/debentures, T-bills, etc. In fact, option contracts may be traded for any financial asset for which there is an active secondary market. The major distinction between options and futures arise from the phrase *without obligation*. While the holder of an option need not exercise his right if the price movement of the underlying asset is adverse, the holder of a futures contract has to honour the contract even if it means incurring loss. Of course, since nothing in the world is free, the price (which is also known as *premium*) of an option is much higher than the price of a comparable futures contract. In other words, by locking in the future buying or selling price, options provide investors with the opportunity to insure the risk arising from price fluctuations. However this comes at a price, which is also referred to as *premium*.

There are two major classification of options – Call and Put; European and American. Crossing these two classification types, we arrive at four major types of options. The explanation pertaining to all these types is beyond the scope of this paper. So, for the sake of this paper, only Call European Option is defined. A *Call European Option* is a type of option which confers the right, but not obligation on the holder to purchase the underlying asset, say, stock at a pre-determined price, *Exercise price or Strike Price*, only on a pre-determined date.

Call European option *premiums* pertaining to different options on the same underlying asset or security exhibit large variations. Like all securities traded on stock exchanges the options premium are governed by several fundamental factors. Prominent among them are *Strike Price, Current market price of underlying stock, Volatility of underlying stock, Time to Expiry*.

Each of these factors impact call European option prices differently. The impact of determinants on Call European Option Prices may be summarized as below:

TABLE – 1: IMPACT OF DETERMINANTS ON CALL EUROPEAN OPTION PRICES

Factor	Effect of an increase of factor on Call Price	Effect of an decrease of factor on Call Price
Strike Price	Decrease	Increase
Current price of underlying stock	Increase	Decrease
Time to Expiry	Increase	Decrease
Volatility of underlying stock	Increase	Decrease

Thus, it is clear that call European option price shares direct proportionality with market price, time to expiry and volatility of underlying stock and inverse proportionality with Strike Price.

BLACK-SCHOLES MODEL

Black-Scholes model (B&S model), as we all know, is a model that seeks to establish the OPTION PRICE. The model takes determinants of option prices as independent variables and OPTION PRICE as a dependent variable. We will know about B&S model in some detail later.

LITERATURE REVIEW

Since Black and Scholes published their seminal article on option pricing in 1973, there has been vast explosions of theoretical and empirical investigation on option pricing. While Black and Scholes' assumption of geometric Brownian motion still maintained in most papers, the possibility of alternate distributional

hypotheses was soon raised later. Cox, Ross and Rubenstein (1979) derived the tree methods of pricing options, based on risk-neutral valuation, the binomial option pricing model pricing European option prices under various alternatives, including the absolute diffusion, pure-jump, and square root constant elasticity of variance models.

After stochastic interest rate extensions first appeared in Merton (1973), Merton (1976) proposed a jump-diffusion model. Models for pricing options under stochastic volatility appeared in Hull and White (1987), Johnson and Shanno (1987), Scott (1987), and Wiggins (1987). New models for pricing European options under alternate distributional hypotheses continue to appear; for instance, Naik's (1993) regime-switching model and the implied binomial trees model of Derman and Kani (1994) and Rubinstein (1994).

NEED AND IMPORTANCE OF STUDY

Options have become the most sought-after derivatives. But given the complexity of the mechanisms and factors involved in determining the option prices, it is becoming extremely difficult for investors as well as academicians to forecast option prices. In this regard, it becomes all the more important to study the factors behind determination of option prices and checking the veracity of the existing models of option price determination. This paper is a sincere attempt in this direction.

STATEMENT OF THE PROBLEM

Option Prices or premiums differ widely for different options on the same underlying asset or stock. This clarifies that option premiums are governed not just traditional factors of demand and supply but also by the multiplicity of other factors. This would bewilder many investors. In this research, an attempt has been made to understand/establish a few important factors that significantly affect the option prices and the magnitude of such effects. Also an attempt has been made to measure the degree of interrelationship among these factors. The Factors considered include – the market price of the underlying asset, the volatility of the market price of the underlying asset, the strike price, and the time to expiry.

Black-Scholes model is regarded to be the most scientific model determining the option prices. An attempt has been made to examine the veracity of this model with respect to the actual option premiums quoted in options market.

OBJECTIVES

1. To explore the strength of relationship between Call European Option Price on the one hand and the each of the important determinants on the other across five prominent industries of Indian Options Market separately.
2. To explore the strength of relationship between Call European Option Price on the one hand and the each of the important determinants on the other for Indian Options market as whole.
3. To empirically examine the veracity of Black-Scholes model in terms of degree of overvaluation or undervaluation of call European option prices by the model.

RESEARCH METHODOLOGY

SAMPLE DESIGN

The study is carried out on the NSE listed- call European options (of expiry date February 23, 2012) of sampled companies from five prominent industries and the findings have been generalized to Indian Options market.

Five industries – Banking, Energy, FMCG, Information Technology and Pharmaceuticals- have been assumed to be the representative of the Indian Options market. Five companies have been chosen from each of the five sectors and are assumed to be representative of their sectors. The list of companies is given below. Convenient Sampling technique has been adopted. The companies which have traded well in the respective industries have been considered on the basis of our individual judgment.

Banking	Energy	FMCG	Information Technology	Pharmaceuticals
State Bank of India	Oil and Natural Gas Corporation	ITC	Patni Computer Systems Ltd	Ranbaxy
Vijaya Bank	National Thermal Power Corporation	Hindustan Unilever	Tata Consultancy Services	Dr Reddy's Laboratories
Indian Overseas Bank	Gas Authority of India Ltd	Dabur	Infosys	Cipla
Punjab National Bank	Indian Oil Corporation	Godrej India Ltd	Wipro	GlaxoSmithkline
Bank of India	Coal India Ltd	Tata Global Beverages Ltd	Tech Mahindra	Piramal Healthcare

DATA COLLECTION

Secondary data has been used to carry out the research. The data pertaining to the call European option prices for a period of 10 weeks has been considered. The call European option prices have been collected from www.nseindia.com. The data pertaining to the theoretical understanding of the phenomena have been collected from the relevant books.

TOOLS OF ANALYSIS

Correlation has been used to establish relationship between the call European option prices on the one hand and the factors influencing options prices on the other hand. This tool helps in ascertaining the strength and direction of relationship and helps us understand which factor influences the option prices substantially. Regression analysis has been used to build a model that will help in the determination of call European option prices. Percentage has been used to analyze the extent to which actual call European option prices differ from those arrived at by Black-Scholes Model.

LIMITATIONS

The study has been limited to the call European options of only 25 companies from five sectors. The quality of the research is subject to the sampling error i.e. the extent to which these companies do not represent the Indian Options market.

DATA ANALYSIS AND INTERPRETATION

For the sake of convenience, data analysis and interpretation has been divided into 3 sections on the basis of 3 objectives mentioned above.

Analysis of relationship between call European options Price and each of the determinants across five industries separately

The relationship between call European option price on the one hand and the strike price, the spot price, volatility of the underlying asset and time to expiry of option on the other hand across the five industries, taken for study, separately has been analyzed and interpreted.

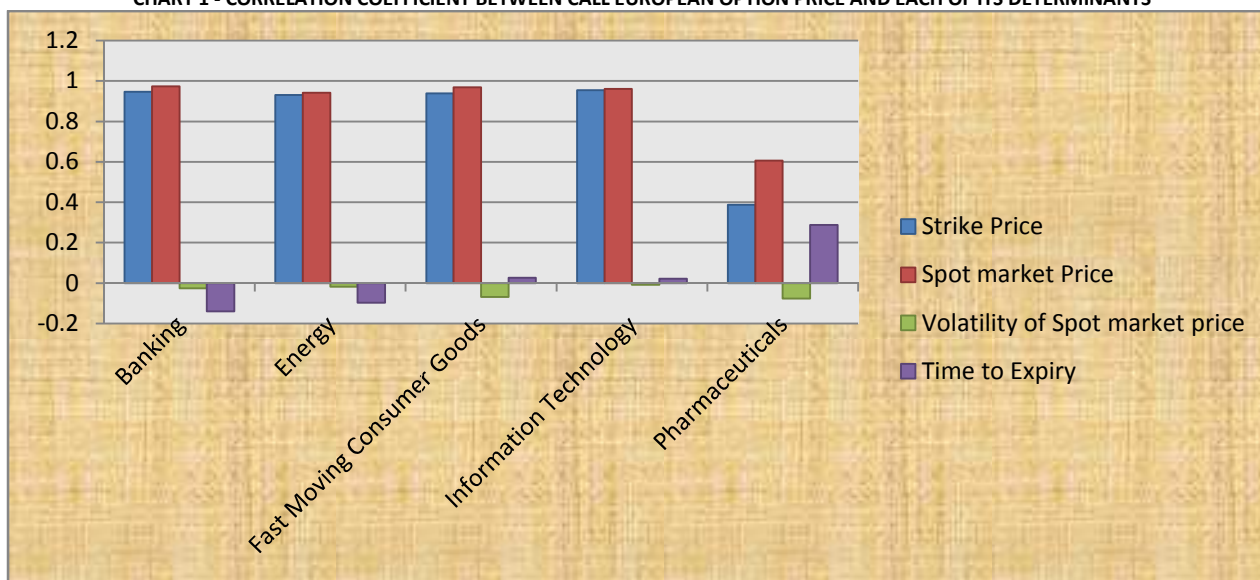

The Karl Pearson's Co-efficient of Correlation has been computed between the call European option prices and each of the determinants for all the five companies in each of the five industries taken for study. The findings may be summarized as below:

TABLE 2 – CORRELATION COEFFICIENT BETWEEN CALL EUROPEAN OPTION PRICE AND EACH OF ITS DETERMINANTS

Correlation Coefficient between Call European option price and.....	Banking	Energy	Fast Moving Consumer Goods	Information Technology	Pharmaceuticals
Strike Price	0.946	0.930	0.939	0.954	0.387
Spot market Price	0.973	0.942	0.968	0.961	0.606
Volatility of Spot market price	-0.026	-0.018	-0.069	-0.008	-0.077
Time to Expiry	-0.140	-.097	0.027	0.022	0.287

CHART 1 - CORRELATION COEFFICIENT BETWEEN CALL EUROPEAN OPTION PRICE AND EACH OF ITS DETERMINANTS

ANALYSIS

Karl Pearson’s Coefficient of Correlation indicates the strength of relationship between two variables i.e. call European option price and each of the determinant as the case may be. A positive coefficient indicates the direct relationship, whereas a negative coefficient indicates the inverse relationship. From table-2, it is clear that *Spot Market Price* of the underlying stock of call European option price has the highest direct relationship with call European option price in all the five industries. However it is to be noted that the relationship is the strongest in case of Banking, Energy, FMCG and IT industries where the co-efficient stands over 0.94, implying that out of 100 instances, in more than 94 instances *Spot Market Price* and the call European option premium vary in the same direction with same magnitude. But, in case of Pharmaceuticals industries, the strength of relationship between call European option prices and spot price is relatively lower at 0.606, implying that the chances of variance of the two being same is 60.6 out of 100.

The influence of *Strike price* on the call European option price comes second with slightly lower correlation coefficient in the options having underlying stocks of the industries except those of Pharmaceuticals. However, the impact of strike price on call European option price in case of options having stocks of Pharmaceuticals industry is pretty less at just 0.387 denoting that in only 38.7 cases out of every 100 cases do the *Strike Price* and call European option prices vary with the same magnitude.

The *volatility of underlying stock prices* shares an inverse relationship with call European option prices in all the industries. However, its impact is negligible since the correlation coefficient is less than 0.1 in all the options of all the industries.

The *time to expiry*, like volatility of underlying stock prices do not wield significant influence in the cases of options of Banking, Energy, FMCG and IT industries. But in the case of options of Pharmaceuticals industry, it does wield some influence with correlation coefficient standing at 0.287, meaning that in only 28.7% of the cases do the *time to expiry* and call European option Price share common variance. Contrary to the popular perception of time to expiry sharing an inverse relationship with call European option prices, it is observed direct relationship, though insignificant, is found with respect to call European options of FMCG, IT and Pharmaceuticals industries.

In a nutshell, *Spot price and Strike Price* influence the premium of Call European options of all the industries except Pharmaceuticals. The influence of *time to expiry and volatility of stock prices* is rather less. In case of Pharmaceuticals industry options, the influence of Spot price is high but not as strong as in the cases of other industry options. The influence of *strike price* is well below that of other industry options. But, the influence of time to expiry is relatively higher.

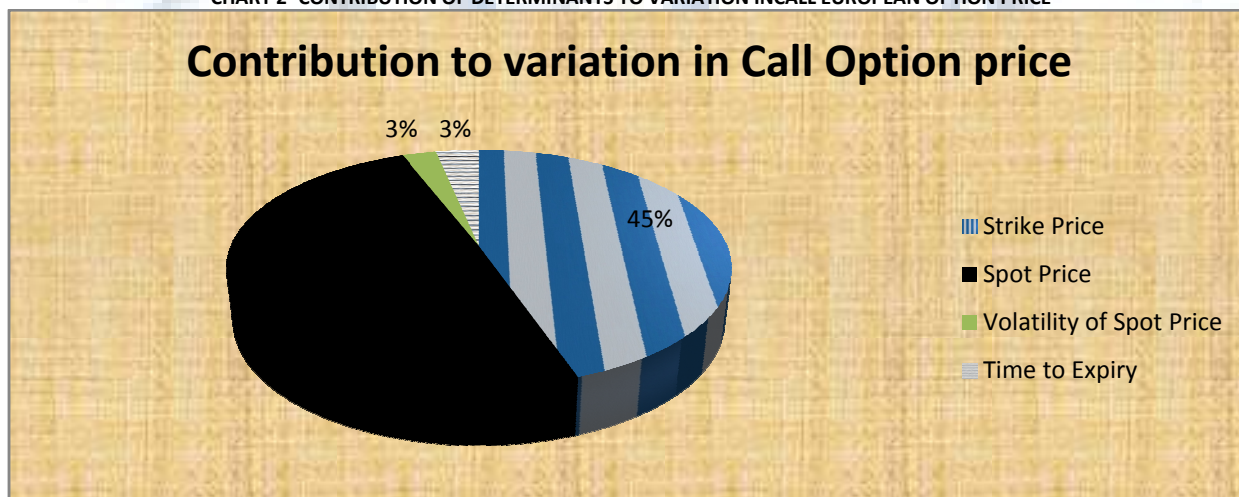

Analysis of the strength of relationship between call European option Price and each of the determinants for Indian Options market as a whole

The relationship between the call European option price on the one hand and each of the determinants separately on the other for the entire call European options market (as represented by all the five industries under study) has been analyzed and interpreted.

TABLE 3 - CORRELATION COEFFICIENT BETWEEN CALL EUROPEAN OPTION PRICE AND EACH OF DETERMINANTS FOR CALL EUROPEAN OPTIONS MARKET AS A WHOLE

Determinant	Correlation Coefficient
Strike Price	0.776
Spot Price	0.859
Volatility of spot price of underlying stock	-0.045
Time to expiry	0.057

CHART 2 - CONTRIBUTION OF DETERMINANTS TO VARIATION INCALL EUROPEAN OPTION PRICE

ANALYSIS

The Chart-2 shows the break-up of the influence of various factors on the call European option prices. Here only the strength of the relationship is considered, ignoring whether the relationship is positive or negative.

It can be deciphered from the above chart that the maximum contribution to the variation of the call European option prices is made by the *Strike Price*, followed by *Spot Price*. Both these factors jointly account for 94% of variation. So it becomes all the most clear that the holder of the call European option must take these two factors predominantly into consideration while ascertaining the likely call European option price that he must quote or be quoted.

In relation to the *Strike Price* and *Spot Price*, the volatility of spot price and time to expiry contributes minimally to the variations in the call European option prices. Jointly they account for just 6% of variation with each of the volatility of spot price and time to expiry contributing just 3%.

This analysis brings us close to one inference: *Only the visible factors wield power to bring about variation in the call European option prices while the invisible factors which indirectly influence the call European option prices cannot influence the call European option prices significantly.*

EMPIRICAL EXAMINATION OF THE VERACITY OF BLACK-SCHOLES MODEL

The call European option price under B&S model is given by,

$$C(S, t) = N(d_1) S - N(d_2) K e^{-r(T-t)}$$

$$d_1 = \frac{\ln\left(\frac{S}{K}\right) + \left(r + \frac{\sigma^2}{2}\right)(T - t)}{\sigma\sqrt{T - t}}$$

$$d_2 = \frac{\ln\left(\frac{S}{K}\right) + \left(r - \frac{\sigma^2}{2}\right)(T - t)}{\sigma\sqrt{T - t}} = d_1 - \sigma\sqrt{T - t}.$$

- $N(\cdot)$ is the cumulative distribution function of the standard normal distribution
- $T - t$ is the time to maturity
- S is the spot price of the underlying asset
- K is the strike price
- r is the risk free rate (annual rate, expressed in terms of continuous compounding)
- σ is the volatility of returns of the underlying asset

The call European options are valued as the difference between the current value of the money to be paid to purchase underlying stock in stock market and the

discounted value of the exercise price to be paid to purchase stock on maturity. $N(d_1) S$ and $N(d_2) K e^{-r(T-t)}$ represent the former and latter respectively. The underlying stock prices are assumed to follow the pattern of normal distribution.

As mentioned earlier, the call European option prices for 10-weeks have been considered. The data have been averaged on weekly basis. The Call European Option Prices have been calculated as per the above equation for 10 weeks. This B&S option price has been compared with the respective weekly average actual call European option premium. The call European option is considered *undervalued* if the latter is less than the former. On a reverse token, the call European option is considered *overvalued* if the latter is more than the former.

The extent to which the call European option has been *overvalued* or *undervalued* is computed by the percentage of instances of *overvaluation* or *undervaluation* respectively.

The computation of overvaluation/undervaluation of call European option prices of Tata Global Beverages Ltd options is produced as under:

The table-4 calculates the call value (B&S model) of Tata Global Beverages Ltd call European options for 10 weeks and compares the same with the respective weekly average of actual call European option premium. The *remark* row indicates overvaluation (O)/ undervaluation (U).

The same procedure has been followed to arrive at overvaluation/undervaluation of call European option prices of all the 25 companies taken for study. The paucity of space has made the production of all those tables here impossible.

CHART 3 - OVERVALUATION AND UNDERVALUATION OF CALL EUROPEAN OPTIONS ACROSS INDUSTRIES SEPARATELY

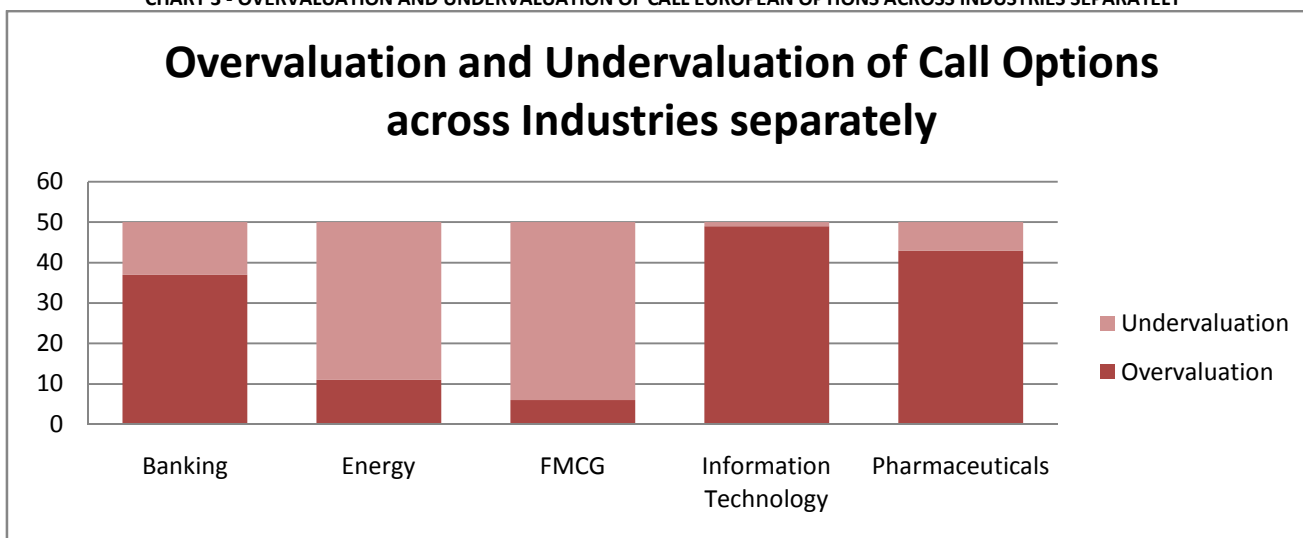

CHART 4 - CONSOLIDATED OVERVALUATION AND UNDERVALUATION OF CALL EUROPEAN OPTIONS

ANALYSIS AND INTERPRETATION

From the table-5 and Chart – 3&4, it can be observed that in 58% of cases the call European options are *overvalued*. And in the remaining 42% of cases, the call European options have been *undervalued*.

It can also be observed that the *overvaluation* is mostly with respect to call European options having the stocks of Information technology, Pharmaceuticals and Banking industry. It is to be noted with significance that Information technology call European options are *undervalued* only once.

With respect to *undervaluation*, the call European options having the stocks of Energy and FMCG industry as underlying stocks are mostly *undervalued*. In case of FMCG call European options, they have been *undervalued* in 88% of cases i.e. in 44 out of 50 cases.

It can be concluded that call European options of IT, Pharmaceuticals and Banking stocks are likely to be *overvalued* and the call European options of FMCG and Energy stocks are likely to be *undervalued* by Black-Scholes model. The reasons for *undervaluation* or *overvaluation* of stocks by Black-Scholes model can be summed up as below:

- The B&S model takes into account standard deviation of underlying stock as a measure of stock’s volatility and prices the call European options of more volatile stocks high and vice versa. However, call European option holders may not be rational enough to measure the volatility of the stock and they price the call European options according to their whims and fancies.
- The B&S model assumes that the prices of underlying stocks resemble normal distribution. However, in reality this may not be true. The *Random-Walk theory* states that the stock prices do not follow any fixed pattern. So the call European option holders may not perceive the prospects from call European options as done by B&S mode.
- The B&S model assumes that the risk-free rate of return and payment of dividends are constant and do not have any implication on the pricing of call European options. However, both these factors will have their influence on call European option prices. The payment of dividend will lead to reduction in stock prices and thus, obviously, call European option holders intend to pay less for call European options with underlying stocks whose dividends are likely to be announced. B&S model does not take this into account.

Given the assumptions behind Black-Scholes model and the relevance of those assumptions in real world, it can be concluded from the above analysis, B&S model hardly helps in determining the call European option prices as being traded in options market. Nevertheless, B&S model has great academic utility. No other model is more scientific and efficacious in the determination of call European option prices as B&S model. Thus, its academic importance and relevance cannot be ruled out.

FINDINGS

Scrulous analysis of subject-matter has yielded valuable insights. They can be meticulously summarized as below:

➤ The influence of top three determinants on prices of call European options of various industry options can be summarized as below:

	Banking	Energy	FMCG	Information Technology	Pharmaceuticals
Rank 1	Spot Price	Spot Price	Spot Price	Spot Price	Spot Price
Rank 2	Strike Price	Strike Price	Strike Price	Strike Price	Strike Price
Rank 3	Time to Expiry	Time to Expiry	Time to Expiry	Time to Expiry	Time to Expiry

- The determinants of call European option prices for the Indian Options market as a whole can be arranged in the descending order of the strength of their influence on option prices as: *Spot Price, Strike Price, Time to Expiry and Volatility of spot price of underlying stock prices.*
- The empirical examination of the veracity of B&S model has yielded rich insights which can be summarized as below:
- The B&S model is likely to *overvalue* the call European options to the extent of 58%. The model is likely to *undervalue* the call European options to the extent of 42%.
 - It can also be observed that the *overvaluation* is mostly with respect to call European options having the stocks of Information technology, Pharmaceuticals and Banking industry as underlying assets.
 - The call European options having the stocks of Energy and FMCG industry as underlying assets are mostly *undervalued*.
 - No generalization can be made whether B&S model *undervalues* or *overvalues* the call European option prices since the difference between the extent of *overvaluation* and *undervaluation* is minimal (16%)

SUGGESTIONS

Any research work will lose significance if it fails to have any practical utility. The motive behind choosing this research topic is to equip call European option holders and prospective call European option holders with a few valuable tips necessary to make gainful investment.

- The quoting of premium in call European options need not be crudely decided upon. There is a scientific logic behind the determination of call European option premium. Investors are suggested to take stock of the factors – *spot price of underlying stock, strike price, time to expiration of call European options and volatility of underlying stock price (in order of priority as found in research)* – in quoting the premium.
- The call European option holders are advised to examine the performance of the stocks of their choice for about six months. They are advised to undertake *technical analysis* to forecast the future stock price and buy the call European options whose strike price is considerably less than the sum of forecast stock price and quote the premium.
- The investors are also advised to predominantly base their premium decision on *spot price of underlying stock and strike price*. The other two factors - *time to expiration of call European options* – do not wield much influence and can be conveniently ignored.
- The academic utility of *Black-Scholes Model* can hardly be overemphasized. But the research has established that it barely estimates the call European option premium exactly. So the call European option holders are advised not to base their investment decisions on B&S model.

CONCLUSION

To end, the prospective and present call European option holders should evaluate the influence of spot price and strike price before quoting the premium and should not depend on Black-Scholes model in deciding their premium.

REQUEST FOR FEEDBACK

Dear Readers

At the very outset, International Journal of Research in Computer Application and Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail infoijrcm@gmail.com for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail infoijrcm@gmail.com.

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

Academically yours

Sd/-

Co-ordinator

ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
