## **CALL FOR MANUSCRIPTS**

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the areas of Computer Science & Applications; Commerce; Business; Finance; Marketing; Human Resource Management; General Management; Banking; Economics; Tourism Administration & Management; Education; Law; Library & Information Science; Defence & Strategic Studies; Electronic Science; Corporate Governance; Industrial Relations; and emerging paradigms in allied subjects like Accounting; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Rural Economics; Co-operation; Demography; Development Planning; Development Studies; Applied Economics; Development Economics; Business Economics; Monetary Policy; Public Policy Economics; Real Estate; Regional Economics; Political Science; Continuing Education; Labour Welfare; Philosophy; Psychology; Sociology; Tax Accounting; Advertising & Promotion Management; Management Information Systems (MIS); Business Law; Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labour Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; International Relations; Human Rights & Duties; Public Administration; Population Studies; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism & Hospitality; Transportation Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic; Web Design and emerging paradigms in allied subjects.

Anybody can submit the **soft copy** of unpublished novel; original; empirical and high quality **research work/manuscript** **anytime** in **M.S. Word format** after preparing the same as per our **GUIDELINES FOR SUBMISSION**; at our email address i.e. [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com) or online by clicking the link **online submission** as given on our website ([FOR ONLINE SUBMISSION, CLICK HERE](#)).

## **GUIDELINES FOR SUBMISSION OF MANUSCRIPT**

1. **COVERING LETTER FOR SUBMISSION:**

DATED: \_\_\_\_\_

**THE EDITOR**  
IJRCM

**Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF.**

**(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)**

**DEAR SIR/MADAM**

Please find my submission of manuscript entitled ' \_\_\_\_\_ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

**NAME OF CORRESPONDING AUTHOR:**

Designation:  
Affiliation with full address, contact numbers & Pin Code:  
Residential address with Pin Code:  
Mobile Number (s):  
Landline Number (s):  
E-mail Address:  
Alternate E-mail Address:

**NOTES:**

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:  
**New Manuscript for Review in the area of** (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers, and email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

**INTRODUCTION****REVIEW OF LITERATURE****NEED/IMPORTANCE OF THE STUDY****STATEMENT OF THE PROBLEM****OBJECTIVES****HYPOTHESES****RESEARCH METHODOLOGY****RESULTS & DISCUSSION****FINDINGS****RECOMMENDATIONS/SUGGESTIONS****CONCLUSIONS****SCOPE FOR FURTHER RESEARCH****ACKNOWLEDGMENTS****REFERENCES****APPENDIX/ANNEXURE**

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure. Sources of data should be mentioned below the table/figure.** It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
  - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
  - Use (ed.) for one editor, and (ed.s) for multiple editors.
  - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
  - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
  - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
  - For titles in a language other than English, provide an English translation in parentheses.
  - The location of endnotes within the text should be indicated by superscript numbers.

**PLEASE USE THE FOLLOWING FOR STYLE AND PUNCTUATION IN REFERENCES:****BOOKS**

**ABSTRACT**

Today's inevitable need is getting the correct information within specified time frame. For satisfying our requirement, it is very important to make the information secured from being damaged or tempered by any unauthorized user. There are many upcoming techniques in the field of information security. This paper enlightens us about possible methods of securing an information, starting from the most basic and traditional method i.e. password based, ID based and biometric trait based. As we all know that there are various possible biometric traits like fingerprint, hand recognition, iris based, retina scan, face recognition etc. In this paper we have chosen finger print for further research. Based on the study about these methods i.e. password based, ID based and biometric trait based, the better method is also suggested. We also discuss various threats prevailing in the field of securing a biometric trait like latent print attacks, Trojan horse and fake feature attacks. We also state literature review as much of the work is already done in this field. After mentioning the already existing work, we discuss the current issues and challenges like robustness, performance, interoperability etc. We also discuss research objective to elaborate the work done in field of securing a biometric trait, followed by future scope and conclusion.

**KEYWORDS**

Physical Trait, Authentication, Steganography, Cryptography, Watermarking.

**INTRODUCTION**

From past many years, security has been a major concern, whether we talk about securing any product, information or identity of a person. Although many methods, techniques and algorithms are being implemented, some of them are good to a large extent but threats are still prevailing. Here, in this paper we will be concentrating on securing identity of a person. Again many minds are on their tracks to design a foolproof technique for the same.

As we know that there are various schemes like password based, ID based and physical trait<sup>1</sup> based.

In the password based scheme, every user is provided with a password. When he wants to access any resource, he is asked to submit the password which is matched with the one, stored in the database. Once there is a match the resource is accessible to the user, else not.

In case of ID based security, the person is given an Identity Card. This card contains the information about the person. At the time of request for any resource the user has to show the card, after checking the required credentials, user is authenticated to use that resource.

In physical trait<sup>1</sup> scheme the user provide an impression of finger print on the sensor which, along with the person's details, is saved as a template in the database. At the time of verification, the user is again asked to give the fingerprint sample which is then matched with already saved template. Depending on the result, the user is allowed to access the resources.

Apart from matching the sample, there are measures to check the authentication accuracy, namely FRR<sup>2</sup> and FAR<sup>3</sup>.

As per the above discussion, it is analyzed that a system using physical trait is better as compared to password or ID based systems. Biometric systems possess a complicated architectural design, incorporating complex modules as it deals with different kind of data. Apart from being complicated these types of system face major problems, and root of all is Security. Securely saving a template, protecting it from unauthorized access, transferring the template without any errors and many more aspects are to be worked upon.

<sup>1</sup>Here physical trait means Finger print Sample

<sup>2</sup>FRR means that a genuine person is denied to access the resources

<sup>3</sup>FAR means that a fake person is given the access to the resources

**EXISTING WORK DONE**

Fengling Han et al. [11], discuss a chaotic approach for encrypting fingerprint images by using a 2D chaotic sequence which is obtained from multi scroll chaotic attractors. For generating the private key, initial values of chaotic attractors are used.

Before the actual work is done, a large number of features of fingerprints including overall ridge flow pattern, ridge frequency, location and position of singular points, minutiae points, location of pores etc. she proposed two fingerprint authentication schemes. The first one is local fingerprint matching scheme where images are captured and processed at local system. Second is centralized matching scheme where image is captured at local site and are sent to central point via network, also used in ATM banking systems.

They also suggest different schemes that can be used to protect digital image/video from attacker i.e. digital watermarking and encryption. They also state that normal encryption algorithms like DES, IDEA and RSA are not suitable for biometric image encryption.

Juan M. Vilaridy et al. [14], in their paper discuss a digital algorithm i.e. fractional fourier transform to encrypt fingerprint data samples. In the process of encryption, a grayscale image of fingerprint is taken and it's placed as the phase of a complex exponential, then is transformed five times and multiplied in intermediate steps by four random phase masks statistically independent, thus to obtain the encrypted fingerprint.

On the other hand, in the process of decryption, the encryption procedure is applied in the inverse sense to the conjugated complex of the encrypted fingerprint, then is taken the negative of the phase of the resulting image of the decryption process and the original fingerprint is obtained this way that had been encrypted.

In the complete process nine keys are used constituted of five fractional orders and four random phase masks.

The Mean Square Error (MSE) between the input fingerprint and our decrypted fingerprint is calculated to validate the reliability of this algorithm.

Colin Soutar et al. [9] emphasized on understanding the interface between biometric systems and general security systems is critical for the successful deployment of biometric technologies. They states that at the time of sending private/ confidential data, the problems such as identity, replay and hill climbing attacks must be avoided.

*Daesung Moon et al.* [10], state that biometric-based authentication can provide a strong security guarantee of the identity of users. They propose a secure and efficient protocol to transmit fingerprint images from a fingerprint sensor to a client by exploiting the characteristics of the fingerprint images. To reduce the computational workload of applying the algorithm on full finger print sample, they suggest to apply the encryption algorithm to a nonce for integrity and to a specific bitplane of each pixel of the fingerprint image for confidentiality. Experimental results show that the integrity and confidentiality of the fingerprint images can be guaranteed without any leakage of the fingerprint ridge information and can be completed in real-time on embedded processors.

## TYPE OF ATTACKS

There are various types of severe attacks to the components of biometric systems.

**Latent print attacks.** Sometimes, we can extract previous finger print features from the sensor itself, as the impression of finger is left on the surface of sensor which can be activated at later point of time.

**Trojan horse virus** may also attack computer systems, therefore it is advisable to perform any kind of biometric processing in a separate hardware outside the system.

**Fake feature attack**, more commonly known as Spoofing, is also a kind of attack in which mechanical copies of the feature are designed, which is shielded by liveness detection technique to a large extent.

Irrespective of the sensor, a stored template can be replayed into the system i.e. a copy of finger print can be replayed in the database.

Being easy to use, easy to install and of requiring less investment, fingerprint analysis is majorly in practice as compared to other biometric techniques. In order to promote this technique and for enhancing its reach to many other areas, first an increased security is demanded.

There are various techniques to provide impart security such as cryptography, watermarking and steganography.

S.Brindha and Ila.Vennila (2011), states that Cryptography is a process of hiding information into an unintelligible (encrypted) form for the purposes of secure transmission. Through the use of a "key" the receiver can decode the encrypted message (decrypting) to retrieve the original message.

Steganography improves on this by hiding the fact that a communication even occurred. The message  $m$  is imbedded into a harmless message  $c$  which is defined as the cover-object. The message  $m$  is then embedded into  $c$ , generally with use of a key  $k$  that is defined as the stego-key. The resulting message is then embedded into the cover-object  $c$ , which results in stego-object  $s$ . Ideally the stego-object is indistinguishable from the original message  $c$ , appearing as if no other information has been encoded.

While cryptography focuses on methods to make encrypted information meaningless to unauthorized parties, steganography is based on concealing the information itself.

Watermarking is very similar to steganography in a number of respects. Both seek to embed information inside a cover message with little to no degradation of the cover-object. Watermarking however adds the additional requirement of robustness. An ideal steganographic system would embed a large amount of information, perfectly securely with no visible degradation to the cover object. An ideal watermarking system however would embed an amount of information that could not be removed or altered without making the cover object entirely unusable.

Watermarking technique provides solution to ensure the validity of biometrics; proposed scheme is composed of three parts: watermark embedding, data embedding and data extraction. They also states the difference between encryption and watermarking highlighting the advantages of using watermarking. Firstly, watermark is imperceptible. Secondly, the watermarks and the works they embedded in are inseparable.

## CURRENT ISSUES AND CHALLENGES

As we all know that, the output of any system depends upon the input provided. Similarly, the result of a fingerprint recognition system depends on the quality of fingerprint sample inputted. The fingerprint image depends on various factors like skin conditions, sensor conditions etc. A poor quality image results in missed features which in turn along with lack of robustness, degrade the performance of the system. Thus accepting a sample of good quality and maintaining its validity is a major challenge.

Sensor interoperability is also a major area of concern. Different vendors are designing different kind of sensors on the basis of customer's needs and preferences. But once we talk about comparing the samples taken from different sensors, we are restricted to do so. Thus changing a sensor may affect performance of the system. Thus to solve this issue, common data exchange formats should be developed to facilitate the exchange of feature sets between vendors.

Today, the fingerprint sensors are embedded in various devices like mobile phones and PDAs to provide security. But the sensor, being of small in area leads to less overlap between fingerprint positions of same finger which hampers performance of the system.

## RESEARCH OBJECTIVE

After studying all the aspects, we have analyzed that there are many algorithms designed in this filed. I have decided to study Multi-algorithm multibiometrics System, where as the name suggest, more than one algorithm is implemented to identify the user. Based on the study, my aim is to design an optimized algorithm to make a finger print sample more secure, so that the scope of finger print recognition system could be widened.

## FUTURE SCOPE

There are some high security areas where security based on one trait is not sufficient. The logic behind is, if anyone loose the particular trait e.g. person loose his hand then the system will not be able to recognize the user, even if he is the authorized one. In this paper we have emphasized on security aspect of Finger prints which could be extended to providing security on the basis of other Biometric traits like hand, face, iris, retina etc. Work can also be extended to combining more than one physical feature, depending on the requirement, to provide security.

## CONCLUSION

As we have seen that out of many possible methods of information security i.e. password based, ID card based and biometric based, later is better. On one hand, if we consider simplicity and installation, then former method is chosen. But we consider better security, then biometric method should be the choice. Thus the implementation of technique depends upon granularity of secrecy of information and the level of security needed. Apart from the fact that in biometric trait method there are some threats, we can believe that those can be worked upon. There are many great minds which are trying to impart security with the techniques like watermarking, steganography and cryptography. On the basis of literature survey we can conclude that watermarking is comparatively simple to implement. If anyone wants to implement any of the biometric trait method then there is different kind of data would be studied. Such as, in fingerprints, to understand the features one should have in depth knowledge of minutiae, ridges patterns etc. We have also discussed the current issues and challenges, which emphasized on robustness, performance and interoperability. The day when all hindrances are over, biometric technique will be used all over the world and that too in all the fields.

## REFERENCES

### BOOKS

1. Hand Book of Biometrics Jain, Anil K.; Flynn, Patrick; Ross, Arun A. (Eds.) 2008, X, 556 p. 60 illus.

### CONFERENCE PAPERS

2. An Introduction to Multibiometrics Arun Ross(2007), West Virginia University, 15th European signal processing conference.

3. Ann Cavoukian (2008). Biometric Encryption: A Transformative Technology that Delivers Strong Security and Privacy. Information and Privacy Commissioner Ontario. Institute of Electrical and Electronics Engineers 6th Biometrics Symposium
4. Joseph Lewis (2002). Biometrics for secure Identity Verification: Trends and Developments. University of Maryland, Bowie, State University.
5. Ontario (2008). Biometric Encryption: A Transformative Technology that Delivers Strong Security and Privacy. Institute of Electrical and Electronics Engineers 6th Biometrics Symposium.

**THESIS**

6. Umut Uludag (2006). Secure Biometric Systems. (Doctoral Dissertation, Michigan State University).

## **REQUEST FOR FEEDBACK**

**Dear Readers**

At the very outset, International Journal of Research in Commerce, IT and Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail i.e. [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com) for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail [infoijrcm@gmail.com](mailto:infoijrcm@gmail.com).

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

**Academically yours**

Sd/-

**Co-ordinator**

## ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
