CALL FOR MANUSCRIPTS

We invite unpublished novel, original, empirical and high quality research work pertaining to recent developments & practices in the area of Computer, Business, Finance, Marketing, Human Resource Management, General Management, Banking, Insurance, Corporate Governance and emerging paradigms in allied subjects like Accounting Education; Accounting Information Systems; Accounting Theory & Practice; Auditing; Behavioral Accounting; Behavioral Economics; Corporate Finance; Cost Accounting; Econometrics; Economic Development; Economic History; Financial Institutions & Markets; Financial Services; Fiscal Policy; Government & Non Profit Accounting; Industrial Organization; International Economics & Trade; International Finance; Macro Economics; Micro Economics; Monetary Policy; Portfolio & Security Analysis; Public Policy Economics; Real Estate; Regional Economics; Tax Accounting; Advertising & Promotion Management; Business Education; Management Information Systems (MIS); Business Law, Public Responsibility & Ethics; Communication; Direct Marketing; E-Commerce; Global Business; Health Care Administration; Labor Relations & Human Resource Management; Marketing Research; Marketing Theory & Applications; Non-Profit Organizations; Office Administration/Management; Operations Research/Statistics; Organizational Behavior & Theory; Organizational Development; Production/Operations; Public Administration; Purchasing/Materials Management; Retailing; Sales/Selling; Services; Small Business Entrepreneurship; Strategic Management Policy; Technology/Innovation; Tourism, Hospitality & Leisure; Transportation/Physical Distribution; Algorithms; Artificial Intelligence; Compilers & Translation; Computer Aided Design (CAD); Computer Aided Manufacturing; Computer Graphics; Computer Organization & Architecture; Database Structures & Systems; Digital Logic; Discrete Structures; Internet; Management Information Systems; Modeling & Simulation; Multimedia; Neural Systems/Neural Networks; Numerical Analysis/Scientific Computing; Object Oriented Programming; Operating Systems; Programming Languages; Robotics; Symbolic & Formal Logic and Web Design. The above mentioned tracks are only indicative, and not exhaustive.

Anybody can submit the soft copy of his/her manuscript **anytime** in M.S. Word format after preparing the same as per our submission guidelines duly available on our website under the heading guidelines for submission, at the email address: infoijrcm@gmail.com.

GUIDELINES FOR SUBMISSION OF MANUSCRIPT

1. **COVERING LETTER FOR SUBMISSION:**

DATED: _____

THE EDITOR
IJRCM

Subject: SUBMISSION OF MANUSCRIPT IN THE AREA OF _____.

(e.g. Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)

DEAR SIR/MADAM

Please find my submission of manuscript entitled ' _____ ' for possible publication in your journals.

I hereby affirm that the contents of this manuscript are original. Furthermore, it has neither been published elsewhere in any language fully or partly, nor is it under review for publication elsewhere.

I affirm that all the author (s) have seen and agreed to the submitted version of the manuscript and their inclusion of name (s) as co-author (s).

Also, if my/our manuscript is accepted, I/We agree to comply with the formalities as given on the website of the journal & you are free to publish our contribution in any of your journals.

NAME OF CORRESPONDING AUTHOR:

Designation:

Affiliation with full address, contact numbers & Pin Code:

Residential address with Pin Code:

Mobile Number (s):

Landline Number (s):

E-mail Address:

Alternate E-mail Address:

NOTES:

- a) The whole manuscript is required to be in **ONE MS WORD FILE** only (pdf. version is liable to be rejected without any consideration), which will start from the covering letter, inside the manuscript.
- b) The sender is required to mention the following in the **SUBJECT COLUMN** of the mail:
New Manuscript for Review in the area of (Finance/Marketing/HRM/General Management/Economics/Psychology/Law/Computer/IT/Engineering/Mathematics/other, please specify)
- c) There is no need to give any text in the body of mail, except the cases where the author wishes to give any specific message w.r.t. to the manuscript.
- d) The total size of the file containing the manuscript is required to be below **500 KB**.
- e) Abstract alone will not be considered for review, and the author is required to submit the complete manuscript in the first instance.
- f) The journal gives acknowledgement w.r.t. the receipt of every email and in case of non-receipt of acknowledgment from the journal, w.r.t. the submission of manuscript, within two days of submission, the corresponding author is required to demand for the same by sending separate mail to the journal.

2. **MANUSCRIPT TITLE:** The title of the paper should be in a 12 point Calibri Font. It should be bold typed, centered and fully capitalised.

3. **AUTHOR NAME (S) & AFFILIATIONS:** The author (s) **full name, designation, affiliation (s), address, mobile/landline numbers**, and **email/alternate email address** should be in italic & 11-point Calibri Font. It must be centered underneath the title.

4. **ABSTRACT:** Abstract should be in fully italicized text, not exceeding 250 words. The abstract must be informative and explain the background, aims, methods, results & conclusion in a single para. Abbreviations must be mentioned in full.

5. **KEYWORDS:** Abstract must be followed by a list of keywords, subject to the maximum of five. These should be arranged in alphabetic order separated by commas and full stops at the end.
6. **MANUSCRIPT:** Manuscript must be in **BRITISH ENGLISH** prepared on a standard A4 size **PORTRAIT SETTING PAPER**. It must be prepared on a single space and single column with 1" margin set for top, bottom, left and right. It should be typed in 8 point Calibri Font with page numbers at the bottom and centre of every page. It should be free from grammatical, spelling and punctuation errors and must be thoroughly edited.
7. **HEADINGS:** All the headings should be in a 10 point Calibri Font. These must be bold-faced, aligned left and fully capitalised. Leave a blank line before each heading.
8. **SUB-HEADINGS:** All the sub-headings should be in a 8 point Calibri Font. These must be bold-faced, aligned left and fully capitalised.
9. **MAIN TEXT:** The main text should follow the following sequence:

INTRODUCTION

REVIEW OF LITERATURE

NEED/IMPORTANCE OF THE STUDY

STATEMENT OF THE PROBLEM

OBJECTIVES

HYPOTHESES

RESEARCH METHODOLOGY

RESULTS & DISCUSSION

FINDINGS

RECOMMENDATIONS/SUGGESTIONS

CONCLUSIONS

SCOPE FOR FURTHER RESEARCH

ACKNOWLEDGMENTS

REFERENCES

APPENDIX/ANNEXURE

It should be in a 8 point Calibri Font, single spaced and justified. The manuscript should preferably not exceed **5000 WORDS**.

10. **FIGURES & TABLES:** These should be simple, crystal clear, centered, separately numbered & self explained, and **titles must be above the table/figure**. **Sources of data should be mentioned below the table/figure**. It should be ensured that the tables/figures are referred to from the main text.
11. **EQUATIONS:** These should be consecutively numbered in parentheses, horizontally centered with equation number placed at the right.
12. **REFERENCES:** The list of all references should be alphabetically arranged. The author (s) should mention only the actually utilised references in the preparation of manuscript and they are supposed to follow **Harvard Style of Referencing**. The author (s) are supposed to follow the references as per the following:
 - All works cited in the text (including sources for tables and figures) should be listed alphabetically.
 - Use (ed.) for one editor, and (ed.s) for multiple editors.
 - When listing two or more works by one author, use --- (20xx), such as after Kohl (1997), use --- (2001), etc, in chronologically ascending order.
 - Indicate (opening and closing) page numbers for articles in journals and for chapters in books.
 - The title of books and journals should be in italics. Double quotation marks are used for titles of journal articles, book chapters, dissertations, reports, working papers, unpublished material, etc.
 - For titles in a language other than English, provide an English translation in parentheses.
 - The location of endnotes within the text should be indicated by superscript numbers.

CAPITAL STRUCTURE DETERMINANTS: CRITICAL REVIEW FOR SELECTED INDIAN COMPANIES

DR. AVANISH KUMAR SHUKLA
ASST. PROFESSOR
DEPARTMENT OF ACCOUNTING
COLLEGE OF BUSINESS
HOSPITALITY & TOURISM STUDIES
FIJI NATIONAL UNIVERSITY
FIJI ISLANDS

ABSTRACT

Capital structure is one of the most significant features of organizational finance and should be managed efficiently. The present study is conducted with an OLS regression method, to identify major determinants of capital structure. The determinants are selected with two prominent theories of capital structure, static trade-off theory and pecking order theory. For conducting the present study, annual reports from 55 companies, listed in stock exchange in India, is collected for last 6 years i.e. from 2006 to 2011. A total number of 330 observations were made. OLS regression for panel data with cross section random effect is run with two equations i.e. total debt to market value of companies and long term debt to market of companies. Analysis shows negative impact of agency cost on total debt ratio of Indian companies. Tax rate is positive only on long term debt and non-debt tax shields are negative on total debt ratio. There is no significant impact of bankruptcy and profitability in determining leverage ratios, while total and long term debt ratios are significantly determined by firm size. Long term debt ratios are significantly determined by firm size. Collateral volume of assets positively influence only total debt ratio while industry characteristic has been found to be a significant determinant of debt ratio.

KEYWORDS

agency cost, bankruptcy cost, profitability, capital structure and tax shield.

INTRODUCTION

A balanced and effective capital structure is of a great concern, in the area of corporate finance. An appropriate capital structure will lead to increased profitability or decreased risk and thus, high share-holders and customer's value. Capital structure is metrics of various probable funds that constitute the assets of the company e.g. higher the proportion of debt in capital structure means higher financial leverages. A wise capital structure decision enables a firm to allocate and control risk.

Previous researches on the topic have aimed to find out:

- The influences of capital structure on firm
- The probable alternatives of capital structure, and
- The determinants of capital structures (Sayeed, 2011)

The present study falls in the last category. In the present study, OLS and Tobit regression have been run on yearly data, ranging from year 2006 to 2011. Prime objective of this study is to investigate the determinants of capital structure in Indian companies. This study differs from other previous studies, as in previous studies, industries like heavy engineering, software technology, telecommunication, oil industries were ignored with some logics. In the present study, author has incorporated all the above mentioned sectors.

In order to simplify, the present study is organized into six sections e.g. literature review, hypothesis, data collection, methodology, result and conclusion.

OBJECTIVE OF THE STUDY

- To identify the determinants of capital structure in the defined sectors of Indian economy
- To identify the main determinants of capital structure that influence the financing decision of choice of the capital structure in the economy.
- To explain the relationship between leverage and capital structure determinant (if possible)

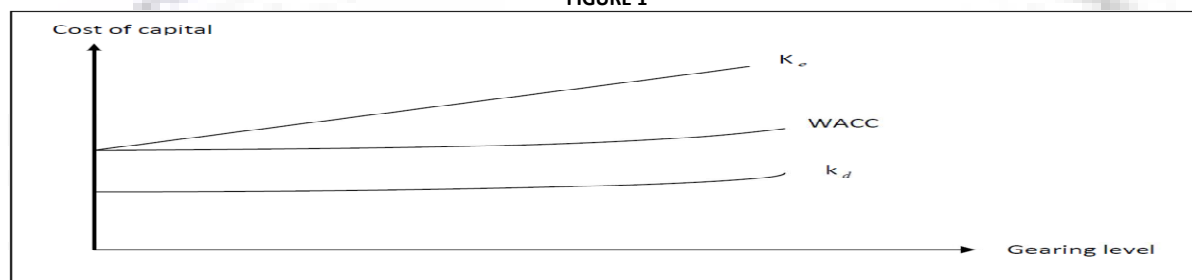

SCOPE OF THE STUDY

This study will try to identify and analyze the determinants of capital structure in Indian economy. In the present analysis, several sectors have been considered e.g. heavy engineering, which have been ignored in the previous studies. The focus of this study is to cover all the major aspects of the topic but preliminary it tried to determine the capital structure of different sectors listed in Security Exchange Board of India, Mumbai, which will help managers to take better financial decision for their organization. Further, this study can also help creditors, to minimize their risk.

THEORIES OF CAPITAL STRUCTURE

Tekar, Tasseren and Tukul (2009) have examined the most significant determinants of capital structure (Dissanayake, 2012). However, in 1958, Modigliani and Miller have pioneered the theory of capital structure, with detonated debate in not only academic but corporate area as well. A general consensus has been established then that the capital structure has a significant impact on firm value (Akhtar, 2005).

One very prime reason, why companies should introduce the capital structure, is to bring down the cost of finance. Here, it does mean that the cost of debt (k_d) is less than the cost of equity (k_e). One remarkable aspect here is that additional amounts of debt would increase both the cost of equity (k_e) and cost of debt (k_d). In spite of this; since the k_d is significantly lower than the k_e the WACC will initially decline (Dissanayake, 2012).

FIGURE 1

Source: Association of Business Executives.

However, theories of capital structure can be divided into two main thoughts; static trade-off theory and pecking order theory. Static trade-off theory advises the firms' decision about capital structure with the help of trade-off between cost and revenue having debt. This debt results in tax deductible and consequently, reduced tax burden. However, it has one major cost i.e. bankruptcy cost (Mazur, 2007). Further, agency cost is also an important cost (Jensen and Mackling, 1976, Myers, 1977), which associates with negating the conflict of interest between, creditors and shareholders (Sayeed, 2011).

Picking order theory describes that managers select capital with the following preferences like internal finance, debt, equity (Myers and Majluf, 1986) with the assumption that managers do not seek any optimal level of leverage. It believes that debt is collected only when internal sources of funds are not adequate.

Based on these two theories, different studies have developed a set of determinants of debt ratio of the firm and have been empirically tested (Sayeed, 2011). Major studies are Akhtar (2005), Mazur (2007), Kim, Heshmati and Aoun (2006), Eldomiati (2007) and Sayeed (2011) etc.

CAPITAL STRUCTURE DETERMINANTS

Leverage ratios have been used to represent the capital structure of a firm in maximum studies. There are differences in selecting the numerator and denominator of the leverage ratio. In the previous researches, some have used long term debt (Chkir and Cosset, 2001) while, rest opted total debt as the numerator (Bevan and Danbolt, 2002). In the case of denominator, some have used market value of firm while rest has used book value of the firm for the study purpose (Graham and Harvey, 2001 and Mazur, 2007). In the present study, researcher has used two measures as a proxy of capital structure. The leverage is defined as:

$$LTDM = \frac{ltd}{ltd + mve}$$

$$TDM = \frac{td}{td + mve}$$

Where:

LTDM: Long term debt measure

TDM: Total debt measure

ltd: Long term debt

mve: Market value of equity

td: Total debt

It has been observed that debt is associated with the Agency cost. Agency cost is widely expressed through, three proxy variable (Akhtar, 2005). The given ratio (known as agency cost), treated as TW in literature was proposed in 1988 by Titman and Wessels:

$$TW = \frac{tdcashandmarketablesecurities}{3\ yearaverageasset}$$

Lehn and Poulson (1989) proposed another variable (cited by Akhtar, 2005, re-cited by Sayeed, 2011) which represents the free cash flow of the firm.

$$LP = \frac{EBIT + dept + Amo - tax - Div}{10\ 000}$$

Where,

EBIT: earnings before interest, tax and abnormal profit

dept: depreciation expenses

Amo: amortization reported separately from depreciation

Tax: total tax paid

Div: total dividend paid

Jensen, Solberg and Zorn (1992) and Mehran (1992) (cited by Akhtar, 2005) have proposed another variable for agency cost (re-cited by Sayeed, 2011), which is given as below:

$$JM = \frac{\Delta TotalAssets}{TotalAssets}$$

Where, $\Delta TotalAssets$ = total asset_t - total asset_{t-1}

It has been observed that leverage reduces if enough agency cost exists in the organization because of the inverse relationship between these two variables. Therefore, it is expected that TW, LP and JM does have negative impact, on the leverage. In the meantime, debt level should be minimum when, bankruptcy cost is high. High volatility, in earnings of a firm indicates the presence of bankruptcy cost (Sayeed, 2011). Akhtar (2005) has used a proxy variable, as the standard deviation of first difference in earnings and the same, has been considered in the present study. So, there should be negative relationship between BC and leverage.

$$BC = \frac{StandarddeviationoffirstdifferenceinEBIT}{TotalAssets}$$

So, our first hypothesis is:

Hypothesis 1: TW, LP, JM and bankruptcy cost should have negative impact on the leverage

As per the trade-off theory, debt reduces the tax liability of the firm. So, if the tax rate is high, firm should have high debt ratio, to reduce the tax load. An effective tax rate, is defined in the literature as (Sayeed, 2011):

$$TAX = \frac{TaxPaid}{profitbeforetax}$$

However, according to De Angelo and Masulis (1980), non-debt tax shields can serve as an alternative, to debt tax shield (Sayeed, 2011). This shield is created by depreciation and is non-cash item which is allowed for tax deduction. If, in any organization, high non-debt tax shield exists, then it will result in reduced tax burden. In this case, a firm will require less amount of debt, to reduce its tax liability. So, the relationship between leverage and non-debt tax shield would be negative:

$$NDTS = \frac{Totalannualdepreciationexpense}{Totalasset}$$

Hence, our second hypothesis is:

Hypothesis 2: There is positive relation between leverage and effective tax rate and higher non-debt tax shields allows, firms to maintain lower leverages

Another variable, that has been widely used in the previous studies is, firm size (Mira, 2005) and (Akhtar, 2005). Bankruptcy risk can be reduced by diversifying the business, if the firm is larger in size. With the same thought, researcher has assumed a positive relation between firm size and debt ratio. Size means in (total assets). Hence, our third hypothesis is:

Hypothesis 3: The bigger the firm, the lower would be the leverage ratio.

Tangible asset provides collateral value, to the assets and thus, they become a determinant of debt ratio, because, it can be used as collateral, to enable firms, to borrow at favourable terms. Following variable were used by different authors e.g. Askar (2005) and Mazur (2007) as the collateral value of the assets:

$$Collateralvalueofasset = \frac{FixedAsset}{Totalasset}$$

So, our forth hypothesis is:

Hypothesis 4: There is positive relation between fixed asset ratio and debt ratio.

As per the pecking order theory of capital structure, all the firms, with more profit, prefer internal sources of financing, than external sources. So, more profitable firms will have less debt level than the low profitable firms. Some authors like Akhtar (2005) and Mazur (2007) measured profitability by net profit, by sales ratio while, others like Mira (2005) have used EBIT, to total asset ratio. In the present study, researcher continued the study, following the method used by Akhtar (2005) and Mazur (2007) with a logic that net profit figure, is more influenced in managerial decisions rather than EBIT:

$$Prof = \frac{NetIncome}{TotalSales}$$

As we discussed, a more profitable firm generally prefers, internal sources of funding rather than external sources, so, **our fifth hypothesis is:**

Hypothesis 5: Debt ratio is negatively related with profitability

DATA COLLECTION

All the data were collected from Indian companies, listed in Security Exchange Board of India, Mumbai. All the selected companies are big giant in the Indian economy. The values are collected from audited and published annual books of the organizations. Annual reports are collected from the websites, some were not available, so, the researcher has personally, requested the organizations for the same. All the annual reports are varied from financial year 2006 to 2011 from the different sectors of the economy. These sectors are; banking with 19 companies, food and health with 2 companies, machinery and infrastructure with 6 companies, minerals with 6 companies, oil and gas with 7 companies, software with 3, steel with 5, telecommunication with 2 and utility with 5 companies. Total number of organizations considered for the analysis is 55. TW is average of 3 year's total asset, so additionally annual reports from 2004 have been collected for the sake of study. The selected sectors and number of the organizations are shown in table one:

TABLE 1: SELECTION OF THE SAMPLE

Sector	No. of Organizations selected	No. of years for analysis	No. of observations made
Banking	19	6	114
Food and health	2	6	12
Machinery and Infrastructure	6	6	36
Minerals	6	6	36
Oil and Gas	7	6	42
Software	3	6	18
Steel	5	6	30
Telecommunication	2	6	12
Utility	5	6	30
Total	55	6	330

The descriptive statistics of the variables are listed in table two

TABLE 2: DESCRIPTIVE STATISTICS OF THE VARIABLES

Variable	Mean	Median	Maximum	Minimum	Std. Dev.

Table 3, analysis shows that multi-collinearity test is not significant for this analysis, so the researcher will not consider it again for the analysis purpose.

METHOD OF THE ANALYSIS

In the present study, Multiple OLS (Ordinary Least square) regression method was run to measure the impact of explanatory variables on leverage ratio for the selected companies. It is obvious from the previous studies like Mera (2005) that panel data can control, heterogeneity among the cross sections and time series data methodology hence, panel data methodology is used in the present study because of the nature of data used for the analysis. Further, cross sectional random effect model is used since, the random effect model provides more accurate estimation of p-values. Tobit regression method is used to verify the results obtained by OLS random effect model. Rajan and Zingales (1995), Akhtar (2005) and Sayeed (2011) used Tobit regression in their studies of capital structure.

The model for the study is as below:

$$Leverage = \alpha + \beta_1 TW + \beta_2 LP + \beta_3 JM + \beta_4 BC + \beta_5 TAX + \beta_6 NDTS + \beta_7 PROF + \beta_8 SIZE + \beta_9 CVA + \beta_{10} Dummy_1 + \beta_{11} Dummy_2 + \beta_{12} Dummy_{13} + \beta_{13} Dummy_{14} + \epsilon \text{ ---- (1)}$$

For the representation of the leverage, LTDM and TDM are used as the dependent variable. When TDM is proxy for the leverage in equation (1) is transferred to:

$$LTDM = \alpha + \beta_1 TW + \beta_2 LP + \beta_3 JM + \beta_4 BC + \beta_5 TAX + \beta_6 NDTS + \beta_7 PROF + \beta_8 SIZE + \beta_9 CVA + \beta_{10} Dummy_1 + \beta_{11} Dummy_2 + \beta_{12} Dummy_{13} + \beta_{13} Dummy_{14} + \epsilon \text{ ---- (2)}$$

While, when TDM is used, the equation will be:

$$TDM = \alpha + \beta_1 TW + \beta_2 LP + \beta_3 JM + \beta_4 BC + \beta_5 TAX + \beta_6 NDTS + \beta_7 PROF + \beta_8 SIZE + \beta_9 CVA + \beta_{10} Dummy_1 + \beta_{11} Dummy_2 + \beta_{12} Dummy_{13} + \beta_{13} Dummy_{14} + \epsilon \text{ ---- (3)}$$

Table no. 4 shows the summary of the hypothesis and expected sign of the coefficients of the each variables:

TABLE 4: EXPLANATORY VARIABLES AND IMPACTS ON THE LEVERAGES

Theories	Explanatory variable	Expected Impact
Static trade-off theory Variable	Agency Cost	
	TW	Negative
	LP	Negative
	JM	Negative
	Other costs:	
	Bankruptcy Cost (BC)	Negative
Pecking order theory Variable	Effective Tax Rate (Tax)	Positive
	Non-Debt tax Shield (NDTS)	Negative
	Profitability (PROF)	Negative
	Size	Positive
	Collateral Value of Assets (CVA)	Positive
	Dummy variables for organizations	Positive / Negative

OLS regression analysis result is given in table 5 where LTDM, is dependent variable to proxy the leverage while table 6 shows the OLS regression analysis result where TDM, is dependent variable, to proxy the leverage. After analyzing these two tables, it is now clear that all of the three agency cost variables have negative coefficient, as the researcher has predicted before. In determining the TDM only, all the variables were significant at 1% level of significance. It shows that firm reduces the total debt in the case of intensified agency cost. However, long term debt ratio is unaffected which means, only short term debt should reduce agency cost.

When we discuss our first hypothesis, it is: **TW, LP, JM and bankruptcy cost should have negative impact on the leverage.** Now, first part of this hypothesis i.e. higher agency cost should have reduced leverage, can be accepted but only if we consider total debt as the leverage ratio. If we consider LTDM, there is no sufficient evidence to support this hypothesis. Akhtar (2005) and Sayeed (2011) have also reported the same result in their studies. Further, bankruptcy cost should also have negative impact on the leverage as per the prediction. However, regression result in both tables is positive. So, hypothesis for bankruptcy cost is rejected.

Next hypothesis is about the effective tax rate and non-debt tax shield. In the hypothesis researcher has assumed that **there is positive relation between leverage and effective tax rate and higher non-debt tax shields allows firms to maintain lower leverages.** Both the tables show positive coefficient as expected, however, it is more relevant in the case of LTDM, and not in the case of TDM, which means, with a higher effective tax rate, firms can replace long term debt with short term debt, because of high interest cost associated with long term debt, to reduce tax burden (Sayeed, 2011). In the case of non-debt tax shield, it has been predicted that it should have negative relation with leverage. The result in both tables confirms the prediction; however, it is significant at 5% level of significance in equation number two. Thus, it clearly indicates that a firm can reduce its' short term debt only when its' non-cash expenditure e.g. depreciation are high. Hence, it is accepted only with total debt ratio. In the previous studies like Akhtar (2005) and Mira (2005), NDTS, was insignificant determinant.

According to next hypothesis, there is positive and significant relation between size of the firm and leverage ratio. Researcher has assumed that **the bigger the firm, the lower would be the leverage ratio** with an argument that bigger firms can reduce their risk with diversified business. The result from the analysis confirms the prediction of the researcher. This result is consistent with the previous studies like Mira (2005) and Sayeed (2011).

Further, the researcher has assumed that CVA should have a positive relation on the leverage of the firm; **there is positive relation between fixed asset ratio and debt ratio.** The result in table 5 shows positive coefficient at 5% level of significance. So, this result supports our hypothesis. Result in table number 6 also supports our prediction.

Last hypothesis is about the profitability. According to this, the researcher has assumed that **Debt ratio is negatively related with profitability.** But the results, in the both tables show, that there is no enough evidence, to support this. The result (coefficient) is insignificant and it means that profitability is not significant

determinant or does not have any significant impact on capital structure decision. Akhtar (2005) and Mazur (2007) have found significant and negative coefficient of this variable and it support then pecking order theory.

TABLE 7: TOBIT REGRESSION RESULTS WITH DEPENDENT VARIABLES LTDM AND TDM

Significance is shown in z-statistics

Variables	Coefficient for LTDM	z-statistics	Coefficient for TDM	z-statistics
C	0.289126	0.8145185	-0.142935	-0.444787

*** AT 1% LEVEL OF SIGNIFICANT

** AT 5% LEVEL OF SIGNIFICANT

*AT 10% LEVEL OF SIGNIFICANT

As per the table 7, regression result, Tobit models and the OLS random effect model are very similar. Agency cost variable like TW and LP have been reveals to have significant negative impact. Further, TAX and NDTS are also negative and found insignificant. BC, is found significant here for the total debt. PROF and CVA do not have any significant coefficient while SIZE has been found significant.

CONCLUSION

In the present study, an advance tool for analysis is applied i.e. OLS regression method. The objective was to know the major determinants of the capital structure in listed and selected Indian companies. This study is based on two prominent theories of the capital structure, static trade-off theory and pecking order theory. For the determination of the possible major capital structure determinants, previous studies have been considered. For the analysis, OLS regression model for panel data with cross section random effect was run. For the sake of the study, there were two equations also, total debt to market value as leverage ratio in one equation while, long term debt to market value as leverage ratio in another. As per the result, it is clear that agency cost is negative but tax rate is positive while non-debt tax shields are again negative on leverage ratio. Bankruptcy cost and profitability are irrelevant in the determination of leverage ratio while form size is positive. Collateral value of the asset has positive influence on total debt ratio only.

The researcher strongly believes that this result may be more reliable, if number of observation can be increased. Again, he has strong believes that managers' personal attitude does have significant impact over the capital structure and it cannot be analyze easily. So, there is adequate space for further studies, with increased number of observation and variables. In the study, human consequences can also be examined, if possible.

ACKNOWLEDGEMENT

My sincere thanks to Dr. Mahendra Ready, Dean, College of Business, Hospitality and Tourism Study, Fiji National University and Prof. Ram Karan, Head of Department, Accounting, CBHTS, Fiji National University for their continuous encouragement towards research.

REQUEST FOR FEEDBACK

Dear Readers

At the very outset, International Journal of Research in Commerce, IT and Management (IJRCM) acknowledges & appreciates your efforts in showing interest in our present issue under your kind perusal.

I would like to request you to supply your critical comments and suggestions about the material published in this issue as well as on the journal as a whole, on our E-mail i.e. **infoijrcm@gmail.com** for further improvements in the interest of research.

If you have any queries please feel free to contact us on our E-mail infoijrcm@gmail.com.

I am sure that your feedback and deliberations would make future issues better – a result of our joint effort.

Looking forward an appropriate consideration.

With sincere regards

Thanking you profoundly

Academically yours

Sd/-

Co-ordinator

ABOUT THE JOURNAL

In this age of Commerce, Economics, Computer, I.T. & Management and cut throat competition, a group of intellectuals felt the need to have some platform, where young and budding managers and academicians could express their views and discuss the problems among their peers. This journal was conceived with this noble intention in view. This journal has been introduced to give an opportunity for expressing refined and innovative ideas in this field. It is our humble endeavour to provide a springboard to the upcoming specialists and give a chance to know about the latest in the sphere of research and knowledge. We have taken a small step and we hope that with the active co-operation of like-minded scholars, we shall be able to serve the society with our humble efforts.
